1.0 EXECUTIVE SUMMARY

Environmental Works, Inc. (EWI) was retained by Associated Wholesale Grocers on July 19, 2019 to perform a Phase I Environmental Site Assessment (ESA) of the Price Chopper Property located at 2107 South 4th Street in Leavenworth, Leavenworth County, Kansas (hereinafter referred to as "subject property" or "Site"). This report may be relied upon/used by Associated Wholesale Grocers and Super Market Developers, Inc. The Phase I ESA was conducted in accordance with the American Society for Testing Materials International (ASTM) E 1527-13 Standard. The Vapor Encroachment Screening practices were conducted in accordance with ASTM E 2600-15. The purpose of the assessment is to identify recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), historical recognized environmental liabilities associated with the subject property.

The summary presented below is general in nature and should not be considered apart from the entire text of the report, with all the qualifications and considerations mentioned therein. Details of our evaluation are discussed throughout and in the appendices of this report.

The subject property is 4.0 acres of commercial land located in an area of commercial and residential development. The Site is developed with an approximately 50,000 square foot (ft²) commercial structure developed in approximately 1991 and currently occupied by a grocery store, Price Chopper, which includes a barber shop, pharmacy, bakery, florist, and deli. A vacant tenant space is present on the southwest corner. The remaining areas of the Site are improved with asphalt-paved parking lots and associated landscaping. The subject property is owned by Four D Company LLC.

Historical Records Review Summary

According to historical documentation, the subject property was developed with various structures, likely residential, with railroad tracks intersecting the Site from north to south as early as 1910. The first available aerial photograph in 1947 indicates the Site was developed with various residential structures, railroad tracks, and Fivemile Creek (in the northeast corner). By 1966, the Site remains the same except for a portion of the east adjoining salvage yard present on the east portion of the Site. Exterior material storage associated with the north adjoining property is also present on the north portion of the Site.

The northeast corner of the Site was cleared for development and improved with storage trailers by 1970. In addition, it appears that Fivemile Creek was redirected to the east during this time. By 1975, the northeast corner was developed with a paved lot and vehicle storage associated with adjoining properties. The remaining area of the Site consisted of residential and commercial structures along the west portion (including a furniture store in 1989) and railroad tracks/access roads through the central portion of the Site.

Railroad tracks and former structures were demolished by 1991 when the current Price Chopper structure with tenant spaces was developed on the east portion of the Site with paved parking to the

west. Due to limited interviews and historical information, EWI also could not confirm all uses of the Site, including the vacant tenant space located on the southwest corner of the Price Chopper structure.

The adjoining properties have historically consisted of a landfill to the north/northeast prior to 1970, auto salvage adjoining to the east and various automotive repair facilities to the northeast (City of Leavenworth Garage/Leavenworth Service Center) and south across Marion Street.

EWI requested documentation for the Site and surrounding properties from the City of Leavenworth. The City provided a copy of a Phase II Environmental Site Assessment dated December 1989 conducted for the Site prior to construction of the current Price Chopper. The Phase II ESA was performed in response to a previous Phase I ESA dated October 27,1989 which identified potential off-site contaminant sources to the "north, east and southeast". Adjacent properties to the north were identified as Great Western Manufacturing, GNB Batteries and the Leavenworth Service Center (also identified as the City Garage)/former landfill and properties to the east and southeast were identified as auto salvage yards with automotive repair shops to the south. EWI was not provided a copy of the previous Phase I ESA for review.

At the time of the Phase II investigation, two residences, a furniture store and small sheds were located on the subject property. The remaining area consisted of undeveloped land with an unimproved road (Third Street) and railroad line intersecting the Site.

Three (3) discrete shallow soil samples (B-1, B-2 and B-3) were collected from 2 feet below ground surface (bgs) along the east property line and two (2) discrete soil samples (MW-3 and MW-4) were collected from 3 feet bgs near the northeast corner of the Site in order to identify "possible lead and/or petroleum contamination" associated with former underground storage tanks (USTs) on the adjoining Leavenworth Service Center property that previously leaked "an undetermined amount of gasoline" and the adjoining auto salvage yard. Concentrations of lead were detected at approximately 20 parts per million (ppm) in each of the samples which was reportedly within typical background levels for the area. The samples at MW-3 and MW-4 identified total petroleum hydrocarbons (TPH) at concentrations of 140 ppm and 260 ppm respectively.

Six (6) monitoring wells were also installed at the subject property during the Phase II ESA. Three wells were installed along the northern property boundary (MW-1, MW-2 and MW-3), two wells along the eastern property boundary (MW-4 and MW-5) and one well (MW-6) in the southwest corner. No detectable concentrations of benzene, toluene, xylene or total lead were identified in groundwater at MW-1, MW-2, MW-3 or MW-5. No volatile or semi-volatile compounds were detected above 5 parts per billion (ppb) at MW-3, MW-5 or MW-6. Analytical results at MW-4 (along the northeast portion of the Site) identified elevated concentrations of metals in groundwater that were above National Drinking Water Standards for the time. In addition, a concentration of 18 ppb was detected for an unidentified semi-volatile compound in groundwater at MW-4. According to the Phase II narrative, the groundwater impacts at MW-4 are potentially attributed to the former landfill and/or auto salvage facility to the east.

Based on a review of results from the Phase II ESA, petroleum impacts were detected in shallow soil and concentrations of metals and semi-volatile compounds were detected in groundwater along the northeast portion of the Site. These impacts were potentially attributed to nearby industrial uses including the former landfill, auto salvage and Leavenworth Service Center (also identified as the City Garage).

A Subsurface Exploration Report was also conducted for the proposed Price Chopper at Fourth & Marion Streets in October 1989. Miscellaneous rubble fill including gravel, brick, concrete, wood, metal and cinders were identified in borings advanced in the area of the proposed Price Chopper (north/northeast portion of the Site).

Regulated Sites Summary

The Site was not identified in the regulatory database searched by Environmental Data Resources, Inc. (EDR). The following facilities were identified within the approximate minimum search distance with potential for impact to the subject property:

A former landfill (City of Leavenworth Old City Landfill, City of Leavenworth 2nd & Limit Dump) was identified in the CITY DUMPS and SOLID WASTE FACILITY (SWF) databases and historically located north/northeast and cross-gradient to down-gradient of the Site. EWI interviewed Mr. Mike Gordon and Mr. Mike Hooper from the Public Works Department at the City of Leavenworth regarding their knowledge of the former landfill. Mr. Gordon and Mr. Hooper stated that to their knowledge the landfill was previously located north/northeast of the Site and was closed by approximately 1970 when the City Garage was developed in its place. Mr. Gordon and Mr. Hooper could not recall any sampling activities or investigation conducted at the landfill; although they could recall evidence of waste observed during construction activities onsite and the surrounding area. EWI submitted a records request to Kansas Department of Health and Environment (KDHE) for additional information on the former adjoining landfill. KDHE provided an inspection form for the landfill dated August 15, 2018. According to the inspection, the former landfill was in acceptable condition with no visible wastes. No violations were found. No information was available regarding sampling or investigation of the former landfill. Based on close proximity and the landfill's operation prior to environmental regulation, the facility is considered a REC and VEC to the Site.

Leavenworth, City of, Garage/City Garage/Leavenworth Municipal Garage Area was identified in the Superfund Enterprise Management System - Archive (SEMS-ARCHIVE), leaking underground storage tank (LUST), UST, Resource Conservation Recovery Act - Non Generator/No Longer Listed (RCRA-NONGEN/NLR) databases and was previously located northeast and cross-gradient to down-gradient of the Site at South 3rd and Marion Street. EWI requested documentation from KDHE and the City of Leavenworth regarding former operations and investigations at the facility. A LUST incident was reported for the facility in February 1991 in response to the removal of a 6,000-gallon fuel oil UST. A LUST incident was also reported in November 1992 when a 300-gallon waste oil UST and

associated lines were removed from the facility. KDHE provided Buried Tank Leak Assessments (BTLAs) for both incidents and no leaking or contamination surrounding the USTs were reported; however, no sampling was conducted to confirm or deny impact to the subsurface. These incidents are closed. No information was provided regarding location of the former USTs. The facility has been listed as a non-generator since 2003 but was historically a small-quantity generator (SQG) in 1987 for benzene, tetrachloroethylene, spent non-halogenated solvents and ignitable waste. EWI reviewed a compliance inspection conducted at the facility in September 1991. The inspection identified employees disposing of paint waste and paint contaminated thinner by dumping the material on the ground north of the sign shop. Visibly contaminated soil was observed in this area. Evidence of waste paint and paint thinner was also observed being dumped into a storm drain near the sign shop which discharges to the east adjoining Fivemile Creek. In December 1991, soil samples were collected from 6 inches bgs and 18-24 inches bqs from six locations north of the sign shop. Based on a sampling map provided by KDHE, EWI determined that the sign shop was located approximately 135 feet northeast of the Site. The samples were composited into two samples (one 6 inch and one 18-24 inch sample) and analyzed for RCRA 8 metals, toxicity characteristic leaching procedure (TCLP) Organic Compounds and volatile organic compounds (VOCs). 1,1,2,2-tetrachloroethane, chlorobenzene and xylenes were detected at 19,000 parts per billion (ppb), 12 ppb and 28 ppb respectively in the composite sample collected from 6 inches bgs. No detections were identified in the sample from 18-24 inches bgs. KDHE determined that although contamination was present at the facility, it did not meet the definition of hazardous waste; therefore, areas of visible contamination was recommended to be removed and disposed. As of April 1992, approximately 60 cubic yards of contaminated soil was reportedly removed from the adjoining property and disposed of at the Leavenworth Landfill. No confirmation sampling appears to have been conducted following the soil removal from the facility. In addition, groundwater was not evaluated during the assessment. An additional complaint was issued for the facility in 1991 which noted oil contamination in the area of the vehicle maintenance garage. Based on a review of aerial photographs, the vehicle maintenance garage likely adjoined the Site to the northeast from at least 1970 to 1991. Vehicle storage is also depicted on the east portion of the Site in the 1985 aerial. Based on close proximity and a history of non-compliance, the City Garage formerly located on the northeast of the Site is considered a REC and VEC.

EWI also reviewed the following documentation for the Leavenworth Animal Control facility located northeast of the Site:

The City of Leavenworth provided a Field Report dated July 8, 2013 associated with the construction of the Leavenworth Animal Control (developed on the previous Leavenworth City Garage property). The report indicates that "tanks" were removed from the facility on July 2, 2013. Two of the tanks were reportedly "relocated to the northeast of the site", still on the City of Leavenworth's property. During this relocation, tank contents were reportedly spilled on the ground surface. The Field Report includes a photograph (on Page 4) that identifies "spillage" from the tank removal. The spillage appears to be northeast of the Price Chopper structure located on the subject property. A Field Report dated August 14, 2013 indicates that the tank spillage had not been cleaned up to date. In addition, tank spillage had

previously been observed on standing water "north of the Price Chopper parking lot". The tanks removed during the construction of the Leavenworth Animal Control are potentially attributed to the former City Garage.

Great Western Manufacturing Co. adjoins the Site to the north and is located cross-gradient of the Site at 2017 South 4th Street and was listed as a SQG in 1993, 2000, 2003 and from 2005-2018. The facility was also listed as a large quantity generator (LQG) in 1994. The facility generates ignitable waste, benzene, methyl ethyl ketone, tetrachloroethylene, trichlorethylene and spent chromium, non-halogenated solvents. No violations have been reported. According to documentation provided, the facility manufacturers sieves and sifters used in the flour industry. KDHE provided documentation associated with a Hazardous Waste Compliance Assistance Visit (CAV) in 2012. Various deficiencies were cited during the visit; however, these do not appear to have impact on the subject property. EWI also reviewed historical inspections dated 1987 which indicate that waste paint and spent paint booth filters were historically being disposed of in the dumpster. At the time of the inspection, Safety-Kleen was disposing of waste solvent associated with onsite parts washing; however, correspondence states that the facility previously dumped waste solvent on the ground or in the trash. The timeframe associated with the practice of improper solvent dumping is unknown. Based on the close proximity of the facility and history of solvent dumping, the facility has potential to impact the subject property and is considered a REC and VEC.

Casey's General Store - #2826, located 100 feet west and up-gradient of the Site at 2100 South 4th Street currently utilizes a 20,000-gallon gasoline UST, a 12,000-gallon gasoline UST and a 8,000-gallon diesel UST installed in 2009. EWI submitted a request for additional information from KDHE and received documentation including registration and installation of the USTs. In addition, EWI reviewed correspondence dated June 29, 2010, August 3, 2010, July 12, 2011 in which KDHE noted that they had not received satisfactory inventory control records and/or monthly monitoring reports for release detection. Additional correspondence dated May 13, 2014, June 25, 2014, March 21, 2018, March 19, 2019, April 29, 2019 and May 20, 2019 indicate missing function tests for onsite USTs. EWI also reviewed UST inspections conducted by KDHE on November 4, 2011, March 28, 2013, April 18, 2017 and April 1, 2019 which indicated excess fluid in spill bucket. No other violations noted except for minor repairs. Although the facility has a history of missing compliance records, no releases or significant violations have been identified. Based on lack of identified releases, the facility does not pose a REC to the Site.

Site Reconnaissance Summary

The Site is currently occupied by a Price Chopper grocery store.

EWI observed three (3) underground grease traps present in the kitchen areas at the Site. According to Site Manager, Mr. Rory Knight, these grease traps are maintained by a third party on a regular basis. No issues were noted with the grease traps.

EWI observed a hydraulic box compactor in the back storage/stock area in the southeast corner of the structure. According to Mr. Knight, the machinery is maintained by a third party and he was not aware of any leaks or issues with the compactor. EWI also observed a trash compactor on the north side of the structure with oil staining on the equipment and asphalt beneath the compactor. The staining appeared to be minimal and no cracks in the asphalt or drains were observed in the area; on this basis, the staining is considered a de minimis condition.

EWI observed pole-mounted transformers throughout the Site. Three (3) pole-mounted transformers were observed on the northern property boundary, one (1) pole-mounted transformer was observed in the southwest corner of the Site, and four (4) pole-mounted transformers were observed south of the Price Chopper structure. No decals were noted indicating PCB contents. No evidence of release was identified on the casings or ground beneath. In addition, EWI observed three (3) transformers on a platform east of the structure. EWI observed minor staining on the platform beneath the transformers. No evidence of release was observed on the ground beneath.

A receptacle labeled "used cooking oil" was located in the back storage/stock area in the southeast corner of the structure. According to Mr. Knight, the used cooking oil is picked up by a third party contractor on a regular basis.

During the Site reconnaissance, EWI observed an automotive salvage yard east of the Site. According to historical documentation, the automotive salvage yard, identified in the city directories as Lakes Auto Salvage, has adjoined the Site to the east since as early as 1963. Vehicle storage is also visible onsite in the 1966 and 1985 aerial photographs. Based on close proximity in addition to potential operation onsite, the automotive salvage yard is a REC and VEC to the Site.

Conclusion and Opinions

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM E 1527-13 of the Price Chopper Property located at 2107 South 4th Street in Leavenworth, Leavenworth County, Kansas (the subject property or Site). The Vapor Encroachment Screening practices were conducted in accordance with ASTM E 2600-15. Any exceptions to, or deletions from, this standard are described in Section 10.0 of this report.

The following RECs and VECs were identified for the subject property during this assessment:

1. An automotive salvage yard, identified in the city directories as Lakes Auto Salvage, has adjoined the Site to the east since as early as 1963. Vehicle storage is also visible onsite in the 1966 and 1985 aerial photographs. Based on the close proximity in addition to potential operation onsite, the automotive salvage yard is considered a REC and VEC to the Site.

2. A former landfill (City of Leavenworth Old City Landfill, City of Leavenworth 2nd & Limit Dump) was previously located north/northeast of the Site and was closed by approximately 1970. No information was available regarding sampling or investigation of the former landfill. Based on close proximity and the landfill's operation prior to environmental regulation, the facility is considered a REC and VEC to the Site.

3. Leavenworth City Garage was previously located northeast of the Site at South 3rd and Marion Street. Various USTs have been removed from the facility with no information regarding location or sampling to confirm or deny impact to the subsurface. In addition, a history of non-compliance has been identified at the facility including visible oil contamination and disposing of paint waste and paint contaminated thinner on the ground and into a storm drain which discharges to the east adjoining Fivemile Creek. Although visibly contaminated soil was reportedly removed and disposed, no confirmation sampling appears to have been conducted following the removal of the contaminated soil. In addition, groundwater was not evaluated during the assessment. The area is currently occupied by Leavenworth Animal Control. A Field Report dated July 8, 2013 provided by the City of Leavenworth indicates that "tanks" were removed from the facility on July 2, 2013. Two of the tanks were reportedly "relocated to the northeast of the site", still on the City of Leavenworth's property. During this relocation, tank contents were reportedly spilled on the ground surface. Tank spillage had previously been observed on standing water "north of the Price Chopper parking lot". The tanks removed during the construction of the Leavenworth Animal Control are potentially attributed to the former City Garage. Based on close proximity and a history of non-compliance, the City Garage poses a REC and VEC to the Site.

4. Great Western Manufacturing Co. adjoins the Site to the north at 2017 South 4th Street. A historical inspection dated 1987 indicates that waste paint and spent paint booth filters were historically being disposed of in the dumpster at the facility. The facility also previously dumped waste solvent on the ground or in the trash. The timeframe associated with the practice of improper solvent dumping is unknown. Based on the close proximity of the facility and history of solvent dumping, the facility has potential to impact the subject property and is considered a REC and VEC.

Based on a review of results from the 1989 Phase II ESA, petroleum impacts were detected in shallow soil and concentrations of metals and semi-volatile compounds were detected in groundwater along the northeast portion of the Site. These impacts were potentially attributed to nearby industrial uses including the former landfill, auto salvage and Leavenworth Service Center (also identified as the City Garage). In our opinion, additional investigation is recommended to evaluate the Site for subsurface impacts as a result of the RECs and VECs identified during this Phase I ESA.

2.0 INTRODUCTION

2.1 Purpose

The purpose of the Phase I ESA is to perform an All Appropriate Inquiries (AAI) investigation of the Site in support of the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) liability ("Landowner Liability Protections," or "LLPs"). The goal of the investigation is to identify recognized environmental conditions (RECs), controlled recognized environmental condition (CRECs), historical recognized environmental conditions (HRECs), vapor encroachment conditions (VECs), and potential environmental liabilities associated with the subject property and its neighboring properties, in accordance with the ASTM E 1527-13, pursuant to AAI.

ASTM E 1527-13 defines a REC as "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: due to release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment." A material threat is "a physically observable or obvious threat which is reasonably likely to lead to a release that, in the opinion of the environmental professional, is threatening and might result in impact to public health or the environment." RECs do not include de minimis conditions, which are defined as "a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

ASTM E 1527-13 defines a CREC as "a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls)." Note: For example, if a leaking underground storage tank (LUST) facility has been cleaned up to a commercial use standard, but does not meet unrestricted residential cleanup criteria, this would be considered a CREC. The "control" is represented by the restriction that the property use remains commercial. A condition considered by the environmental professional to be a CREC shall be listed in the findings section of the Phase I ESA report, and as a REC in the conclusions section of the Phase I ESA report. Note: A condition identified as a CREC does not imply that the environmental professional has evaluated or confirmed the adequacy, implementation, or continued effectiveness of the required control that has been, or is intended to be, implemented."

ASTM E 1527-13 defines an HREC as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use

restrictions, activity and use limitations, institutional controls, or engineering controls)." Before calling the past release an HREC, the environmental professional must determine whether the past release is a REC at the time the Phase I ESA is conducted (for example, if there has been a change in regulatory criteria). If the environmental professional considers the past release to be a REC at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a REC."

A VEC is the presence or likely presence of chemical of concern (COC) vapors in the sub-surface of the property caused by the release of vapors from contaminated soil or groundwater either on or near the subject property. Evaluation of the potential presence of COC vapors and determining if a VEC exists on the subject property is necessary to meet the United States Environmental Protection Agency (US EPA) requirements for AAI under CERCLA. EWI conducted a Vapor Encroachment Screening (VES) in general accordance with ASTM E2600-15 Standard Guide for Vapor Encroachment Screening on a Property Involved in Real Estate Transactions.

If a VEC is identified, the environmental professional must determine whether the VEC represents evidence of a REC on the subject property under the context of the ASTM E 1527-13 Phase I ESA Standard Practice. The environmental professional will identify the VEC as a REC where the potential for vapor migration into structures is considered likely, or where the contaminant concentrations in the soil, groundwater, or soil vapors on the subject property are significant and likely to result in enforcement against on-site or off-site responsible parties.

2.2 Scope of Work

This Phase I ESA was conducted consistent with the procedures as provided under Innocent Landowners, Standards for Conducting AAI Rule 40 CFR 312 and in accordance with the ASTM E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process, which may be used to comply with the Rule's requirements.

A visual inspection of the subject property was conducted to identify any evidence of historical and current uses that may contribute to environmental risk for the Site. Interviews with local, state, and federal agencies are included in this report. Photographic documentation of the Site is also included in the report. Adjoining properties were observed from the subject site or public rights-of-way to identify any conditions or actions which may have an adverse environmental impact on the subject site. Historical research was performed for the subject property to identify past ownership and land use which may be relevant to identifying potential environmental risks associated with the Site. This final report was prepared to describe and summarize the activities performed at the Site and identify any potential RECs, CRECs, HRECs, VECs, or risks for the subject property. Findings and Opinions and Conclusions sections are included in this report.

Under ASTM E 1527-13, the client is responsible for providing information regarding title records, environmental liens; activity and/or land use limitations, a site diagram, site contact information,

information regarding environmentally-related reduction(s) for the value of the subject property, and the reason the Phase I ESA was performed.

The Scope of Work for this Phase I ESA is included as Appendix A to this report.

2.3 Significant Assumptions

All information regarding the subject property obtained from interviews with the current and past owner(s) of the Site and/or their representatives, agency officials, potential buyers of the property, etc., is assumed to be accurate and complete.

2.4 Special Terms and Conditions

All pertinent information obtained during this assessment is presented in this report. Conclusions and recommendations regarding the environmental condition of the subject property are based on information acquired from a facility site inspection, historical research of the subject property and its adjoining properties, regulatory agency file review, and interviews.

2.5 Limitations and Exceptions

EWI has performed the services in a manner consistent with that level of care and skill ordinarily exercised by other members of our profession currently practicing in the same locality and under similar conditions, within the limitations of the ASTM E 1527-13 Standard and the AAI Rule established by the US EPA (40 CFR, Part 312) in accordance with an agreement between EWI and their Client. The VEC practices were conducted in general accordance with ASTM E 2600-15. The conclusions presented in this report are professional opinions, based solely upon visual observations of the Site and our interpretation of documents reviewed as described in this report. The conclusions are intended exclusively for the purpose outlined herein and at the site location, project, and timeframe indicated. This ESA did not include subsurface or other invasive assessments or other services not particularly identified and discussed herein. Unless specifically included in the scope of work, ASTM-defined non-scope issues and materials not currently deemed hazardous by the US EPA (asbestos containing materials, environmental regulatory compliance, radon, lead-based paint, lead in drinking water, industrial hygiene, health and safety, ecological resources, mold, endangered species or wetlands, etc.) are not included as part of the ASTM requirements of this report.

Further, the conclusions to this assessment are based upon the statements and representations of many individuals and/or agencies. EWI offers no opinion as to the correctness of these statements and representations and disclaims any liability thereof. No other warranty, expressed or implied, is made as to the contents, summary, and conclusions presented herein. It should be recognized that this assessment was not intended to be a definitive investigation of potential impacts at the subject property. It is possible that currently unrecognized impacts may exist at the Site. Conclusions and opinions presented herein apply to property conditions observed at the time of our investigation and

those reasonably foreseeable. They cannot necessarily apply to changes to the subject property of which EWI is unaware and has not had the opportunity to evaluate.

Limiting conditions, data gaps, and deviations from the ASTM Standard (if identified) are noted in the applicable sections of the report and discussed in Section 10.0.

2.6 User Reliance

This report has been prepared expressly for Associated Wholesale Grocers for use in evaluation of the environmental condition of said property. This report may be relied upon/used by Associated Wholesale Grocers and Super Market Developers, Inc. The scope of service performed in execution of this investigation may not be appropriate to satisfy the need of other users, and any use or reuse of this document or the findings, conclusions, or recommendations presented herein is at the sole risk of said users. Use or reliance by any other party is prohibited without the written authorization.

3.0 SITE DESCRIPTION

3.1 Location and Legal Description

The subject property is located at 2107 South 4th Street on the northeast corner of the intersection of South 4th Street and Marion Street in Leavenworth, Leavenworth County, Kansas. The location of the Site is displayed on Figures 1.0 through 3.0 of this assessment.

A brief legal description of the subject property, as obtained from the Leavenworth County Assessor's website, is as follows:

LT 1 BALLS SUB RPLT LESS TR BEG NW COR LT 2, N10'(S), E147.7', S160'(S), W30', N100'(S), W20'(S), N50'(S), W TO POB

3.2 Site and Vicinity Characteristics

The Site is a commercial property located in an area of commercial and residential development.

3.3 Current Use of the Subject Property

The subject property is currently a Price Chopper grocery store. The Price Chopper includes a barber shop, pharmacy, bakery and meat department with a vacant tenant space on the southwest corner.

3.4 Description of Structures, Roads, and Other Improvements

The subject property is approximately 4.0 acres of commercial land, with an approximately 50,000 square foot (ft²) commercial structure developed onsite. The structure is currently occupied by a grocery store, Price Chopper, and has been present onsite since approximately 1991. The remaining areas of the Site are improved with asphalt-paved parking lots and associated landscaping.

The subject property is illustrated on the Site Diagram provided as Figure 2.0.

3.5 Site Owner, Property Manager, and Occupant Information

Site Owner(s):	Four D Company LLC
Site Manager(s):	Mr. Rory Knight, Night Manager at Price Chopper
Site Occupant(s):	Price Chopper

3.6 Current Uses of the Adjoining Properties

Adjoining Properties to the North	Great Western Manufacturing Co., parking lot and City of Leavenworth Animal Control
Adjoining Properties to the East	South 3rd Street, auto salvage yard, Fivemile Creek and vacant land
Adjoining Properties to the South	Marion Street, Advanced Auto & Truck, Wage's Repair
	Service and Lake's Auto Salvage

Adjoining Properties to the West	Parking lot, multi-tenant commercial structure with TMobile,
	Fry's and Subway, South 4th Street, Casey's, Rent-A-Center,
	US Nails

3.7 Physical Setting

Based on field observations and a review of the topographic map, the surface topography of the subject property slopes to the east. The topography in the surrounding area generally slopes towards Fivemile Creek located approximately 175 feet east of the Site. Based on an interpretation of surface topography, groundwater flow direction in the area of the Site is anticipated to be to the east/southeast. An Area Topographic Map of the subject site and surrounding area is included as Figure 3.0.

Actual local groundwater flow direction and levels may vary due to seasonal fluctuations in precipitation, the presence of nearby water bodies, geology, underground structures, or other factors beyond the scope of this study. A hydrogeological investigation is necessary to determine groundwater flow direction/levels with certainty.

4.0 USER PROVIDED INFORMATION

ASTM E 1527-13 defines a user as a person seeking a Phase I ESA of the subject property. A user may include, without limitation, a potential purchaser of the subject property, a potential tenant of the subject property, an owner of the subject property, a lender, or a Site manager.

In accordance with the EPA AAI Rule and ASTM E 1527-13, the user has obligations for performing tasks during this assessment that will help identify the possibility of RECs in connection with the Site in order to obtain certain landowner liability protections (LLPs) from CERCLA liability.

Mr. Joel Riggs, Executive Director of Super Market Developers, Inc., provided the information described above by completing a Client Checklist provided by EWI. The user's responses are summarized in the following sections and a copy of the Client Checklist and any user provided documents are included in Appendix B.

4.1 Title Records

Title records were not provided for review.

4.2 Environmental Liens or Activity and Land Use Limitation (AUL)

EWI was not informed by the user of any environmental liens or Activity and Use Limitations (AUL) in connection with the subject property.

4.3 User's Specialized Knowledge or Experience

Mr. Riggs stated that the Site is currently a grocery store.

4.4 Valuation Reduction for Environmental Issues

In some instances, the environmental condition of a parcel of land has the potential to reduce the value of the subject property. The user must provide the environmental professional/consultant information that the purchase price of the subject property is significantly less than the purchase price of comparable properties. The user should also identify an explanation for the lower price and make a written record of that explanation for the environmental professional/consultant.

The user indicated that to their knowledge the value of the subject property has not been reduced below the price of comparable properties in the immediate area.

4.5 Reason for Performing the Phase I ESA

This Phase I ESA was performed in order to determine if any RECs exist at the subject property in accordance with ASTM E 1527-13 for due diligence, business environmental risk, and CERCLA defense purposes.

5.0 RECORDS REVIEW

5.1 Standard Environmental Records Sources

EWI contracted the services of Environmental Data Resources, Inc. (EDR) to conduct a database search for facilities listed on federal, state, and tribal databases in the area of the subject property. Facilities listed in these databases have reported or suspected releases of hazardous materials and/or petroleum products to the environment, may store such chemicals, and/or generate hazardous waste, and/or are involved in federal or state clean-up activities. The search was performed for the subject property and the approximate minimum search distances specified per database in the ASTM E 1527-13 Standard. EDR searched for listings within the following ASTM-required databases, in addition to other federal, state, local, and proprietary databases. A complete list and description of the databases searched is provided in EDR's Radius Map Report induced in Appendix C.

ASTM-Required Database:

- NPL National Priorities List and State and Tribal Equivalents, facilities listed for priority remedial actions under the Superfund Program (within 1.0-mile)
- DELISTED NPL- Delisted NPL, facilities removed from the NPL (within 0.5-mile)
- SEMS (former CERCLIS) Superfund Enterprise Management System tracks sites in support of the EPA's Superfund Program (within 0.5-mile)
- SEMS-ARCHIVE (former CERCLIS-NFRAP) SEMS-ARCHIVE tracks sites that have no further interest under the Superfund Program (within 0.5-mile)
- SHWS State Hazardous Waste Sites List (State CERCLIS Equivalent) (within 0.5-mile)
- DEL SHWS Facilities removed from the SHWS list (State CERCLIS-NFRAP Equivalent) (within 0.5-mile)
- RCRA CORRACTS Resource Conservation and Recovery Act Corrective Action Report, hazardous waste handles with RCRA corrective action activity (within 1.0-mile)
- RCRA non-CORRACTS TSD RCRA Treatment, Storage & Disposal of hazardous waste...(within 0.50-mile)
- RCRA Generators facilities that generate hazardous waste as part of their normal business practices (subject property and adjoining properties only)
 - RCRA-LQG Large Quantity Generator, 1000 kg/month of non-acutely hazardous waste or 1 kg/month of acutely hazardous waste
 - RCRA-SQG Small Quantity Generator, 100-1000 kg/month of non-acutely hazardous waste
 - RCRA-CESQG Conditionally Exempt Small Quantity Generator, are those that generate less than 100 kg/month of non-acutely hazardous waste
 - RCRA-NonGen/NLR Non Generators/No Longer Regulated, do not presently generate hazardous waste
- US INST CONTROLS and US ENG CONTROLS Institutional and Engineering Controls and Tribal Equivalents (subject property only)

- ERNS Emergency Response Notification System, EPA listing of reported releases (subject property only)
- SWF/LF Permitted Solid Waste and Landfill (within 0.5-mile)
- UST Underground Storage Tank (subject property and adjoining properties for registered tanks)
- LUST Leaking Underground Storage Tanks (within 0.5-mile)
- VCP Voluntary Cleanup Program (within 0.5-mile)
- BROWNFIELDS State Listed Brownfields Facilities, properties addressed by Cooperative Agreement Recipients or Targeted Brownfields Assessments (within 0.5-mile)

EWI reviewed EDR's findings for listings on the subject property and for listings within the approximate minimum search distance with the potential to impact the subject property due to the migrations of known or suspected contamination. Off Site listings were evaluated based on the nature of the database and regulatory status, distance and topographic location from the Site, specific contaminants and the distance contaminants are likely to migrate, local geologic or hydrogeologic conditions (if known), etc. EWI also evaluated "orphan" sites that EDR could located with confidence. If applicable, orphan sites are discussed within this section.

In the following discussions, the words up-gradient, cross-gradient and down-gradient refer to the topographic gradient in relation to the subject property. Groundwater flow direction is assumed to be parallel to the surface topography of the Site and/or surrounding area. The groundwater flow direction and the depth to shallow groundwater would likely vary depending upon seasonal variations in rainfall and the depth to the soil/bedrock interface. Without the benefit of on-site groundwater monitoring wells surveyed to a datum, groundwater depth and flow direction beneath the subject property cannot be directly ascertained.

Unless otherwise noted, the information provided by the regulatory agency database report and other sources referenced in this report, were considered sufficient to evaluate the presence of RECs, CRECs, and HRECs. If determined necessary to supplement the standard environmental record sources, EWI contacted and/or researched additional records summarized in Section 5.2 and/or discussed in the applicable sections of this report. The facilities identified by EDR but not summarized below were determined unlikely to have an adverse environmental impact on the Site based on the available information and consideration of the factors listed above including regulatory status and distance and topographic location from the Site. Facilities identified with potential for impact to the subject property are discussed as follows:

5.1.1 Subject Property Listings

The subject property was not identified in the regulatory databases searched by EDR.

5.1.2 Surrounding Property Listings

The following facilities were identified within the approximate minimum search distance with potential for impact to the subject property:

Site Name:	CITY OF LEAVENWORTH OLD CITY LANDFILL (052-LEA#2), CITY OF
Site Name:	LEAVENWORTH OLD CITY LANDFILL (052-LEA#2), CITY OF LEAVENWORTH 2ND & LIMIT DUMP (052-2ND-LIM)
Databases:	CITY DUMPS, SWF/LF
Address:	South 3rd Street
Distance (feet):	
Direction:	North/Northeast
Gradient	Cross-gradient/Down-gradient
Comments:	A former landfill was identified north/northeast of the Site prior to 1970. EWI
	interviewed Mr. Mike Gordon and Mr. Mike Hooper from the Public Works Department at the City of Leavenworth regarding their knowledge of the former landfill. Mr. Gordon and Mr. Hooper stated that to their knowledge the landfill was located north/northeast of the Site and was closed by approximately 1970 when the City Garage was developed in its place. Mr. Gordon and Mr. Hooper could not recall any sampling activities or investigation conducted at the landfill; although they could recall evidence of waste observed during construction activities onsite and the surrounding area.
	EWI submitted a records request to KDHE for additional information on the former adjoining landfill. KDHE provided an inspection form for the landfill dated August 15, 2018. According to the inspection, the former landfill was in acceptable condition with no visible wastes. No violations were found.
	No information was available regarding sampling or investigation of the former landfill. Based on close proximity and the landfill's operation prior to environmental regulation, the facility is considered a REC and VEC to the Site.
Site Name:	LEAVENWORTH, CITY OF, GARAGE/CITY GARAGE/LEAVENWORTH MUNICIPAL
	GARAGE AREA 2
Databases:	SEMS-ARCHIVE, LUST, UST, RCRA-NONGEN/NLR
Address:	2101 S 3RD/3RD AND MARION
Distance (feet):	
Direction:	Northeast
Gradient	Cross-gradient/Down-gradient
Comments:	EWI requested documentation from KDHE and the City of Leavenworth regarding former operations and investigations at the facility. A LUST incident was reported for the facility in February 1991 in response to the
	removal of a 6,000-gallon fuel oil UST. A LUST incident was also reported in November 1992 when a 300-gallon waste oil UST and associated lines were removed from the Site. KDHE provided Buried Tank Leak Assessments (BTLAs) for both incidents and no leaking or contamination surrounding the USTs were reported; however, no sampling was conducted to confirm or deny impact to the subsurface. These incidents are closed. No information was provided regarding location of the former USTs.
	The facility has been listed as a non-generator since 2003 but was historically a SQG in 1987 for benzene, tetrachloroethylene, spent non-halogenated solvents and ignitable waste. EWI reviewed a compliance inspection conducted at the facility in September 1991. The inspection identified employees disposing of paint waste and paint contaminated thinner by dumping the material on the ground north of the sign shop. Visibly contaminated soil was observed in this area. Evidence of waste paint and paint thinner was also observed being dumped into a storm drain near the sign shop which discharges to the east adjoining Fivemile Creek.
	In December 1991, soil samples were collected from 6 inches below ground

Based on a sampling map provided by KDHE, EWI determined that the sign shop was located approximately 135 feet northeast of the Site. The samples were composited into two samples (one 6 inch and one 18-24 inch sample) and analyzed for RCRA 8 metals, TCLP Organic Compounds and volatile organic compounds (VOCs). 1,1,2,2-tetrachloroethane, chlorobenzene and xylenes were detected at 19,000 parts per billion (ppb), 12ppb and 28ppb respectively in the composite sample collected from 6 inches bgs. No detections were identified in the sample from 18-24 inches bgs. KDHE determined that although contamination was present at the facility, it did not meet the definition of hazardous waste; therefore, areas of visible contamination were recommended to be removed and disposed. As of April 1992, approximately 60 cubic yards of contaminated soil was reportedly removed from the Site and disposed of at the Leavenworth Landfill. No sampling appears to have been conducted to confirm contamination was removed from the facility. In addition, groundwater was not evaluated during the assessment.
An additional complaint was issued for the facility in 1991 which noted oil contamination in the area of the vehicle maintenance garage. Based on a review of aerial photographs, the vehicle maintenance garage likely adjoined the Site to the northeast from at least 1970 to 1991. Vehicle storage is also depicted on the east portion of the Site in the 1985 aerial. Based on close proximity and a history of non-compliance, the City Garage

Site Name:	GREAT WESTERN MFG CO INC
Databases:	RCRA-SQG, US AIRS (AFS)
Address:	2017 S 4TH
Distance (feet):	Adjoining
Direction:	North
Gradient	Cross-gradient
Comments:	The facility adjoins the Site to the north and was listed as a SQG in 1993, 2000, 2003 and from 2005-2018. The facility was also listed as a LQG in 1994. The facility generates ignitable waste, chromium, benzene, methyl ethyl ketone, tetrachloroethylene, trichlorethylene and spent non-halogenated solvents. No violations have been reported. According to documentation provided, the facility manufacturers sieves and sifters used in the flour industry. KDHE provided documentation associated with a Hazardous Waste Compliance Assistance Visit (CAV) in 2012. Various deficiencies were cited during the visit; however, these do not appear to have impact on the
	subject property. EWI also reviewed historical inspections dated 1987 which indicate that waste paint and spent paint booth filters were historically being disposed of in the dumpster. At the time of the inspection, Safety-Kleen was disposing of waste solvent associated with onsite parts washing; however, correspondence states that the facility previously dumped waste solvent on the ground or in the trash. The timeframe associated with the practice of improper solvent dumping is unknown. Based on the close proximity of the facility and history of solvent dumping, the facility has potential to impact the subject property and is considered a REC and VEC.

Site Name:	ADVANCE AUTOMOTIVE
Databases:	ECHO, RCRA-CESQG, FINDS
Address:	319 MARIAN
Distance (feet):	60
Direction:	South
Gradient	Cross-Gradient

Comments	in 1994 for the generation of ignitable waste, benzene and tetrachloroethylene. A compliance evaluation reportedly occurred in November 2017 and no violations were issued. Based on compliant status, distance and cross-gradient orientation,
	the facility does not pose a REC to the Site.

Site Name:	CASEY'S GENERAL STORE - #2826
Databases:	Financial Assurance, UST, EDR HIST AUTO
Address:	2100 S. 4TH STREET
Distance (feet):	100
Direction:	West
Gradient	Up-Gradient
Comments:	The facility is located west of the Site beyond South 4th Street. The facility currently utilizes a 20,000-gallon gasoline UST, a 12,000-gallon gasoline UST and a 8,000-gallon diesel UST installed in 2009. EWI submitted a request for additional information from KDHE and received documentation including registration and installation of the USTs. In addition, EWI reviewed correspondence dated June 29, 2010, August 3, 2010, July 12, 2011 in which KDHE noted that they had not received satisfactory inventory control records and/or monthly monitoring reports for release detection. Additional correspondence dated May 13, 2014, June 25, 2014, March 21, 2018, March 19, 2019, April 29, 2019 and May 20, 2019 indicate missing function tests for onsite USTs. EWI also reviewed UST inspections conducted by KDHE on November 4, 2011, March 28, 2013, April 18, 2017 and April 1, 2019 which indicated excess fluid in spill bucket. No other violations noted except for minor repairs. Although the facility has a history of missing compliance records, no releases, the facility does not pose a REC to the Site.

Site Name:	CENTURY VAN LINES INC
Databases:	Financial Assurance, LUST, UST, RCRA-CESQG, ECHO, FINDS
Address:	211 MARION
Distance (feet):	250
Direction:	Southeast
Gradient	Down-Gradient
Comments:	The facility was listed for a LUST incident which occurred during the removal of a 4,000-gallon gasoline UST and a 4,000-gallon diesel UST. No indication of release was observed during the excavation and the incident was closed in June 2012. In addition, the facility is listed as a CESQG for the generation of ignitable waste, benzene and tetrachloroethylene. No violations are listed. Based on distance and orientation from the Site, the facility does not pose a REC.

5.2 Additional Environmental Records Sources

Additional environmental records sources reviewed by EWI are summarized below and further discussed in the applicable sections of this report. Supporting documentation is included in Appendix D.

Record Source	Contact	Date of Contact	
City of Leavenworth, KS	Ms. Carla K. Williamson, City Clerk	08/01/2 019	The City of Leavenworth provided documentation related to the Site's development as a Price Chopper grocery store (discussed in Section 5.4). The City also provided documentation for the Leavenworth Animal Control facility (formerly occupied by the City of Leavenworth Garage). See below for details.

Record Source	Contact	Date of Contact	Findings
KDHE Bureau of Environmental Remediation (BER)	Ms. Laura Davis	07/29/2 019	The KDHE BER provided documentation for the Casey's gas station located west of the Site and two (2) BTLAs for the former City Garage at 3rd and Marion. This information is discussed in Section 5.1.2.
KDHE Bureau of Waste Management (BWM)	Ms. Debbie Lusby	07/25/2 019	The KDHE BWM provided an inspection form for the former City of Leavenworth landfill, RCRA and compliance information for the former City Garage at 3rd and Marion and RCRA compliance documentation for the north adjoining Great Western Manufacturing. Discussed in Section 5.1.2.
KDHE Closed City Dump Cleanup Program GIS	Not Applicable	07/25/2 019	No dumps were identified in the area of the Site.
KDHE Environmental Interest Finder	Not Applicable	07/25/2 019	Corresponds with Section 5.1.
KDHE Tanks Database	Not Applicable	07/25/2 019	Corresponds with Section 5.1.
KDHE Reported Spills Finder	Not Applicable	07/25/2 019	Corresponds with Section 5.1.

The City of Leavenworth provided a Field Report dated July 8, 2013 associated with the construction of the Leavenworth Animal Control (northeast of the Site). The report indicates that "tanks" were removed from the facility on July 2, 2013. Two of the tanks were reportedly "relocated to the northeast of the site", still on the City of Leavenworth's property. During this relocation, tank contents were reportedly spilled on the ground surface. The Field Report includes photographs including a photograph (on Page 4) that identifies "spillage" from the tank removal. The spillage appears to be northeast of the Price Chopper structure located on the subject property.

A Field Report dated August 14, 2013 indicates that the tank spillage had not been cleaned up to date. In addition, tank spillage had previously been observed on standing water "north of the Price Chopper parking lot".

The tanks removed during the construction of the Leavenworth Animal Control (northeast of the Site) are potentially attributed to the former City Garage.

5.3 Historical Use Information

Historical use information was reviewed for the subject property and surrounding area to identify the likelihood of past uses having led to RECs in connection with the Site. The historical research objectives are to determine the Site and surrounding area historical uses back to the obvious first developed use, to the extent feasible. The following table summarizes the historical sources reviewed and copies are included in Appendix E:

Resource	Years Available	Source
City Directories	1963-2014 (approximately	EDR
	five-year intervals)	
Sanborn Maps	No Coverage	EDR
Aerial Photographs	1947, 1950, 1960, 1970,	EDR

5.3.1 City Directories

City directories are cross-indexed by street address and list occupants alphabetically by name, address, and telephone number. The Site addresses identified in the historical City directories may differ from the current parcel address. A summary of the listings for the Site and pertinent commercial listings in the surrounding area are provided in the following table:

Site/ Surrounding Direction	Listings
Site	2105 S 4th Street: Residential (1963, 1969, 1974, 1979), No Return (1984)
	2107 S 4th Street: Price Chopper (1992, 2005), Rice Garden Inc. (2005, 2010), Four B Corp (1992, 1995, 2000, 2005, 2010, 2014)
	2109 S 4th Street: Residential (1963, 1969, 1974, 1979), Vacant (1984), C & D Sales II new-used furn (1989)
	224 Marion Street: Vacant (1963)
North	228 Marion Street: Residential (1963), Vacant (1969, 1979) 2017 S 4th Street: Johnson Gordon Co. poultry processing equip mfr (1963, 1969, 1974), Simon Johnson Co. food processing equip mfr (1979), Vacant (1984), Great Western Mfg Co. Inc. (1989, 1992, 1995, 2000, 2005, 2010, 2014)

	2030 S 4th Street: Flower Garden ret (1989), Of Ahz (1995), J C Penney Corporation Inc. (2010), Land of Ahz (2000, 2005, 2010, 2014)
	2100 S 4th Street: Leavenworth Motel (1963, 1969, 1974), Burger King Corporation (1979, 1984, 1989, 2005), Casey's General Stores Inc. (2010, 2014)
	2106 S 4th Street: Pay Less Shoe Store (1974, 1979), Freight Furniture Warehouse (1984), Expressi Video movie & vcr rentl (1989), Video Express (1992, 1995), Rent-A-Center Inc. (2005, 2010, 2014)
	2110 S 4th Street: Woellheart Liquor Store (1963), Mc Carbrey's Liquor store (1969), Johnson Liquor Store (1974), Barnhart Dixie E Retail Liquor (1979), Barnhart Retail Liquor (1984), Brune Retail Liquor (1989)

5.3.2 Summary of Sanborn Maps, Aerial Photographs, and Topographic Maps

Readily available historical United States Geological Survey (USGS) topographic maps, historical aerial photographs and historical fire insurance maps produced by the Sanborn[®] Map Company (if coverage exists) were reviewed to evaluate land development and obtain information concerning the history of development of the Site and surrounding area. A chronological summary of the previous Site and surrounding area uses determined through the historical sources review is provided in the following table:

Date Range	Property Uses	Source	
Subject Property			
1890-1894No structures or improvements illustrated.Topographic maps			

Date Range	Property Uses Sub Header	Source
1910	The Site is developed with various structures and	Topographic maps
	railroad tracks intersect the Site.	ropographic maps

An automotive salvage yard, identified in the city directories as Lakes Auto Salvage, has adjoined the Site to the east since as early as 1963. Vehicle storage is also visible onsite in the 1966 and 1985 aerial

photographs. Based on close proximity in addition to potential operation onsite, the automotive salvage yard is a REC and VEC to the Site.

5.4 Previous Environmental Reports and Other Documentation

A Phase II Environmental Site Assessment was also conducted for the Site proposed supermarket (Price Chopper) by Terracon Environmental in December 1989. The Phase II ESA was performed in response to a previous Phase I ESA dated October 27,1989 which identified potential off-site contaminant sources to the "north, east and southeast". Adjacent properties to the north were identified as Great Western Manufacturing, GNB Batteries and the Leavenworth Service Center (also identified as the City Garage)/former landfill and properties to the east and southeast were identified as auto salvage yards with automotive repair shops to the south. EWI was not provided a copy of the previous Phase I ESA for review.

At the time of the Phase II investigation, two residences, a furniture store and small sheds were located on the subject property. The remaining area consisted of undeveloped land with an unimproved road (Third Street) and railroad line intersecting the Site.

Soil samples were collected along the east property line (B-1, B-2 and B-3) and near the northeast corner of the Site (MW-3 and MW-4) in order to identify "possible lead and/or petroleum contamination" associated with former USTs on the Leavenworth Service Center property that previously leaked "an undetermined amount of gasoline" and the adjoining auto salvage yard. Three (3) discrete shallow soil samples were collected 2 feet below ground surface (bgs) along the eastern property boundary via hand auger. No concentrations of total petroleum hydrocarbons (TPH) above 50 parts per million (ppm) were detected in the samples. Concentrations of lead were detected at approximately 20 ppm in each of the samples which was reportedly within typical background levels for the area. In addition, discrete soil samples were collected from MW-3 and MW-4 (northeast portion of the Site) at 3 feet bgs and analyzed for TPH. The samples identified TPH at concentrations of 140 ppm and 260 ppm respectively. The report indicates that a composite soil sample and groundwater sample were also collected in this area during the previous Phase I ESA and no gasoline constituents (i.e. benzene, toluene or ethylbenzene) were detected.

Six (6) monitoring wells were also installed at the subject property during the Phase II ESA. Three wells were installed along the northern property boundary (MW-1, MW-2 and MW-3), two wells along the eastern property boundary (MW-4 and MW-5) and one well (MW-6) in the southwest corner. Groundwater samples collected from MW-1 through MW-5 were analyzed for BTX. Additionally, samples collected from MW-1, MW-2, MW-3 and MW-5 were also analyzed for total lead. Groundwater samples collected from MW-3, MW-4, MW-5 and MW-6 were subjected to a survey search for extractable compounds (semi-volatile compounds) and volatile organic compounds (VOCs). This analysis reportedly was conducted to identify potential organic compounds present as a result of former landfill activities to the north and onsite fill material (from redirecting Fivemile Creek). Lastly, groundwater samples

collected from MW-4 and MW-6 were analyzed for "13 priority pollutant metals" due to potential impact from the landfill, auto salvage yard and other industrial sites.

No detectable concentrations of benzene, toluene, xylene or total lead were identified in groundwater at MW-1, MW-2, MW-3 or MW-5. No volatile or semi-volatile compounds were detected above 5 parts per billion (ppb) at MW-3, MW-5 or MW-6. Analytical results at MW-4 (along the northeast portion of the Site) identified elevated concentrations of metals in groundwater that were above National Drinking Water Standards for the time. In addition, a concentration of 18 ppb was detected for an unidentified semi-volatile compound in groundwater at MW-4. According to the Phase II narrative, the groundwater impacts at MW-4 are potentially attributed to the former landfill and/or auto salvage facility to the east.

Based on a review of results from the Phase II ESA, petroleum impacts were detected in shallow soil and concentrations of metals and semi-volatile compounds were detected in groundwater along the northeast portion of the Site. These impacts were potentially attributed to nearby industrial uses including the former landfill, auto salvage and Leavenworth Service Center (also identified as the City Garage).

A Subsurface Exploration Report was also conducted for the proposed Price Chopper at Fourth & Marion Streets by Terracon Consultants in October 1989. Miscellaneous rubble fill including gravel, brick, concrete, wood, metal and cinders were identified in borings advanced in the area of the proposed Price Chopper (north/northeast portion of the Site).

6.0 SITE RECONNAISSANCE

A visual reconnaissance of the Site and surrounding area was performed on August 6, 2019 to identify uses and conditions with potential to have an adverse environmental impact on the subject property. Accessible interior areas and structures, if any, and the exterior of the Site were inspected. Visual reconnaissance of adjoining properties was limited to areas and facilities that were readily observable from the subject property or from public access areas. Limitations to the site reconnaissance are discussed in Section 10. A Site Diagram is provided as Figure 2.0, and photographic documentation of the inspection is included in Appendix F. The following personnel participated in the Site inspection:

- Ms. Nicole Lounsberry, EWI
- Mr. Rory Knight, Manager at Price Chopper

6.1 General Site Use Information

The Site is currently occupied by a Price Chopper grocery store on the east portion of the Site. The Price Chopper includes a barber shop, pharmacy, bakery and meat department with a vacant tenant space on the southwest corner. A loading dock and stock storage area is present in the southeast portion of the structure. The remaining area consists of asphalt-paved parking.

Site utilities are provided as follows:

• Potable Water Supply — City of Leavenworth, Kansas

6.2 Hazardous Substances or Petroleum Products

The following table summarizes the chemical containers/storage and disposal areas observed during the Site reconnaissance:

Location	Chemical and Quantity	Condition and Notes
Area of the Hydraulic Trash Compactor - North Side of Structure	5-gallon bucket of grease release and two (2) 5-gallon buckets of porta plus	No evidence of release was noted.

6.3 Underground Storage Tanks (USTs) and Above Ground Storage Tanks (ASTs)

A Casey's gas station with active USTs was observed west of the Site across South 4th Street.

A nitrogen AST and an argon AST were observed at the Great Western Manufacturing facility adjoining the Site to the north.

No USTs or ASTs were observed at the Site.

6.4 Site Observations

The following table summarizes the observations made during the Site reconnaissance. Details are provided for uses or conditions identified at the Site or adjoining properties as follows:

Description	Observed or Identified	Details/Comments
Oil/water separators, clarifiers, or sand traps	Yes	EWI observed three (3) underground grease traps present in the kitchen areas at the Site. According to Site Manager, Mr. Knight, these grease traps are maintained by a third party on a regular basis. No issues were noted with the grease traps.
Odors	No	
Pools of liquid	No	
Electrical or Mechanical Equipment With Potential To Contain Polychlorinated Biphenyls (PCBs)	Yes	EWI observed a hydraulic box compactor in the back storage/stock area in the southeast corner of the structure. According to Mr. Knight, the machinery is maintained by a third party and he was not aware of any leaks or issues with the compactor.
		EWI observed a trash compactor on the north side of the structure. EWI observed de minimis staining on the equipment and asphalt beneath.
Transformers - According to federal guidelines, transformers manufactured after July 1979 are required to contain less than 50 parts per million (ppm) PCBs	Yes	EWI observed pole-mounted transformers throughout the Site. Three (3) pole-mounted transformers were observed on the northern property boundary, one (1) pole-mounted transformer was observed in the southwest corner of the Site, and four (4) pole-mounted transformers were observed south of the Price Chopper structure. No decals were noted indicating PCB contents. No evidence of release was identified on the casings or ground beneath. In addition, EWI observed three (3) transformers on a platform east of the structure. EWI observed de minimis staining on the platform beneath the transformers. No evidence of release was observed on the ground beneath
Heating/cooling petroleum fuel source	No	observed on the ground beneath.
Drains or sumps	Yes	EWI observed floor drains throughout kitchen areas at the Price Chopper.
Pits, ponds or lagoons	No	
Stained soil or pavement	No	
Stressed vegetation	No	
Solid waste disposal or fill material on site	Yes	A receptacle labeled "used cooking oil" was located in the back storage/stock area in the southeast corner of the structure. According to Mr. Knight, the used cooking oil is picked up by a third party contractor on a regular basis.
Wastewater (Process water or Treatment System)	No	
Wells	No	
Septic systems or cesspools	No	
Other	Yes	EWI observed a forklift and associated charger/battery in the back storage/stock area in the southeast corner of the structure.

7.0 SITE USE INTERVIEWS

Ms. Nicole Lounsberry interviewed individuals knowledgeable of the uses of the Site and surrounding area. The following individuals were interviewed:

Name:	Title/Role, Company	Interview Type, Contact Information	Date Interviewed
Mr. Rory Knight	Night Manager at Price Chopper	In-person	August 6, 2019

Mr. Knight stated that he has been with Price Chopper since approximately 2004. Mr. Knight stated that at least three (3) underground grease traps were present in the kitchen areas at the Site. To his knowledge, the grease traps are cleaned out by a third party on a regular basis. He was not aware of any issues.

Mr. Knight also stated that a hydraulic box compactor was present in the back storage/stock area. The compactor is maintained by a third party and he was not aware of any spills or issues with the compactor.

Mr. Knight was questioned about the used cooking oil dumpster located in the back storage/stock area. He stated that the used cooking oil is picked up by a third party on a regular basis.

Mr. Knight was not aware of: (1) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the subject property; (2) any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the subject property, or (3) any notices from any government entity regarding any possible environmental violations relating to hazardous substances or petroleum products for the subject property.

8.0 VAPOR ENCROACHMENT SCREENING

The goal of conducting a VES is to identify if a VEC may be present at the Site. A VEC is the presence or likely presence of COC vapors in the sub-surface of the property caused by the release of vapors from contaminated soil or groundwater either on or near the subject property.

The VES practices were conducted in general accordance with ASTM E 2600-15. The guidance includes Tier 1 and Tier 2 screening procedures to identify VECs. The Tier 1 screening starts by assessing the default area of concern (AOC) defined by the approximate minimum search distance or critical distance and then determining if known or suspected contaminated properties with COC vapors exist within the established AOC. The minimum search distance (critical distance) is the upper limit distance a vapor can reasonably be expected to migrate in relatively permeable soil assuming the path of least resistance is directly from the nearest edge of the contaminated media to the nearest subject property boundary.

The default approximate minimum search distance for non-petroleum hydrocarbon COCs (i.e. volatile organic compounds) is identified as 1,760 feet (1/3-mile) from the source to the subject property boundary and the AOC for petroleum hydrocarbons is 528 feet (1/10-mile) from the source to the subject property boundary. The default search distances may be expanded or reduced in the up-gradient, down-gradient, or cross-gradient directions based on the environmental professional's experience in the local area and applying professional judgment to factors such as of physical setting characteristics, estimated regional groundwater flow direction, or hydrogeologic boundaries such as rivers or streams exist which would tend to limit the potential for migration of groundwater or vapors in a particular direction.

The guidance indicates that when groundwater flow direction can be estimated or determined, the cross-gradient or down-gradient search distances can be reduced by utilizing the following default distances, which were determined using the Buonicore Methodology: for non-petroleum hydrocarbon COC vapors 1,760 feet in the up-gradient direction, 365 feet in the cross-gradient direction, and 100 feet in the down-gradient direction; and for petroleum hydrocarbon COCs 528 feet in the up-gradient direction if Light Non-Aqueous Phase Liquid (LNAPL i.e. floating product) is suspected and 95 feet in the cross-gradient direction if no LNAPL is suspected, 100 feet in the down-gradient direction if LNAPL is suspected and 30 feet in the down-gradient position if LNAPL not suspected.

To identify if a VEC exists, EWI conducted a Tier 1 Screening utilizing information collected during the course of the Phase I ESA including an evaluation of the current and historical usage of the property, the physical setting, and the review of the potential sources of subsurface vapor migration through the review of the regulatory agency database summarized in Section 5.1. EWI adjusted the AOC based on the inferred groundwater flow direction in the area of the Site. The Tier 2 Level Screening is a more comprehensive review of existing files and reports to better understand the proximity of impacts and

can be non-invasive or invasive and include sampling. EWI conducted limited Tier 2 screening where non-invasive information was readily available during the course of the Phase I ESA.

The long-term east adjoining automotive salvage yard, former landfill located north/northeast of the Site, north adjoining Great Western Manufacturing Co. and former northeast adjoining City Garage could be potential vapor sources and are considered VECs to the Site.

9.0 ADDITIONAL SERVICES

No additional services outside of the scope of the ASTM E 1527-13 Standard were requested or provided in this assessment.

10.0 DEVIATIONS, LIMITING CONDITIONS, AND DATA GAPS

This Phase I ESA did not deviate from the ASTM E 1527-13 Standard.

As defined in ASTM E 1527-13 a data gap is "a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." Data gaps are only significant if "other information and/or professional experience raise reasonable concerns involving the data gap" which affects the ability to identify RECs. Data gaps may result from incompleteness in any of the activities required by this practice.

A data failure is "a failure to achieve the historical research objectives" of the ASTM E 1527-13 Standard "even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful". The uses of the subject property must be identified at five year intervals, as available, from the present back to the subject property's first developed use, or back to 1940, whichever is earlier. Data failure is a type of data gap.

The following data gaps were identified:

- <u>Site Inspection Limitations:</u> EWI was unable to view all office areas including the vacant tenant space located on the southwest corner of the Price Chopper during the Site reconnaissance.
- <u>Interviews:</u> Current owner contact information was not provided. In addition, EWI was unable to interview the previous owner(s)/operator(s) of the Site because contact information was not readily available.
- <u>Recorded Land Title Records or Environmental Lien Searches</u>: Neither title paperwork or an environmental lien search was provided for the Site by the Client. At the direction of the client, performance of a review for these records was not included as part of the scope of services for this assessment, and EWI assumes the user is evaluating this information outside the scope of this report.
- <u>Data Failure</u>: Intervals greater than five years were encountered during the review of the historical sources. EWI was unable to determine the Site's uses back to first development; however, our historical research extended to the early 1900s. The first use of the Site appears to have been residential. Due to limited interviews and historical information, EWI also could not confirm all uses of the Site, including the vacant tenant space located on the southwest corner of the Price Chopper structure.
- Outstanding Information Requests: None.

• <u>Other:</u> EWI was not provided a copy of the previous Phase I ESA reportedly completed on the subject property in 1989.

An evaluation of the significance of these limitations and missing information with respect to our findings has been conducted, and where appropriate, significant data gaps are identified and discussed in the text of the report.

Based on the review of the available record sources and reasonably ascertainable information including regulatory database information, historical information and Site observations, it is unlikely these data gaps or limitations, affected EWI's ability to determine REC(s) for this report. No significant data gaps were identified during this Phase I ESA.

11.0 FINDINGS

The subject property is 4.0 acres of commercial land located in an area of commercial and residential development. The Site is developed with an approximately 50,000 square foot (ft²) commercial structure developed in approximately 1991 and currently occupied by a grocery store, Price Chopper, which includes a barber shop, pharmacy, bakery, florist, and deli. A vacant tenant space is present on the southwest corner. The remaining areas of the Site are improved with asphalt-paved parking lots and associated landscaping. The subject property is owned by Four D Company LLC.

11.1 Historical Records Review Summary

According to historical documentation, the subject property was developed with various structures, likely residential, with railroad tracks intersecting the Site from north to south as early as 1910. The first available aerial photograph in 1947 indicates the Site was developed with various residential structures, railroad tracks, and Fivemile Creek (in the northeast corner). By 1966, the Site remains the same except for a portion of the east adjoining salvage yard present on the east portion of the Site. Exterior material storage associated with the north adjoining property is also present on the north portion of the Site.

The northeast corner of the Site was cleared for development and improved with storage trailers by 1970. In addition, it appears that Fivemile Creek was redirected to the east during this time. By 1975, the northeast corner was developed with a paved lot and vehicle storage associated with adjoining properties. The remaining area of the Site consisted of residential and commercial structures along the west portion (including a furniture store in 1989) and railroad tracks/access roads through the central portion of the Site.

Railroad tracks and former structures were demolished by 1991 when the current Price Chopper structure with tenant spaces was developed on the east portion of the Site with paved parking to the west. Due to limited interviews and historical information, EWI also could not confirm all uses of the Site, including the vacant tenant space located on the southwest corner of the Price Chopper structure.

The adjoining properties have historically consisted of a landfill to the north/northeast prior to 1970, auto salvage adjoining to the east and various automotive repair facilities to the northeast (City of Leavenworth Garage/Leavenworth Service Center) and south across Marion Street.

EWI requested documentation for the Site and surrounding properties from the City of Leavenworth. The City provided a copy of a Phase II Environmental Site Assessment dated December 1989 conducted for the Site prior to construction of the current Price Chopper. The Phase II ESA was performed in response to a previous Phase I ESA dated October 27,1989 which identified potential off-site contaminant sources to the "north, east and southeast". Adjacent properties to the north were identified as Great Western Manufacturing, GNB Batteries and the Leavenworth Service Center (also identified as the City Garage)/former landfill and properties to the east and southeast were identified as auto salvage

yards with automotive repair shops to the south. EWI was not provided a copy of the previous Phase I ESA for review.

At the time of the Phase II investigation, two residences, a furniture store and small sheds were located on the subject property. The remaining area consisted of undeveloped land with an unimproved road (Third Street) and railroad line intersecting the Site.

Three (3) discrete shallow soil samples (B-1, B-2 and B-3) were collected from 2 feet below ground surface (bgs) along the east property line and two (2) discrete soil samples (MW-3 and MW-4) were collected from 3 feet bgs near the northeast corner of the Site in order to identify "possible lead and/or petroleum contamination" associated with former underground storage tanks (USTs) on the adjoining Leavenworth Service Center property that previously leaked "an undetermined amount of gasoline" and the adjoining auto salvage yard. Concentrations of lead were detected at approximately 20 parts per million (ppm) in each of the samples which was reportedly within typical background levels for the area. The samples at MW-3 and MW-4 identified total petroleum hydrocarbons (TPH) at concentrations of 140 ppm and 260 ppm respectively.

Six (6) monitoring wells were also installed at the subject property during the Phase II ESA. Three wells were installed along the northern property boundary (MW-1, MW-2 and MW-3), two wells along the eastern property boundary (MW-4 and MW-5) and one well (MW-6) in the southwest corner. No detectable concentrations of benzene, toluene, xylene or total lead were identified in groundwater at MW-1, MW-2, MW-3 or MW-5. No volatile or semi-volatile compounds were detected above 5 parts per billion (ppb) at MW-3, MW-5 or MW-6. Analytical results at MW-4 (along the northeast portion of the Site) identified elevated concentrations of metals in groundwater that were above National Drinking Water Standards for the time. In addition, a concentration of 18 ppb was detected for an unidentified semi-volatile compound in groundwater at MW-4. According to the Phase II narrative, the groundwater impacts at MW-4 are potentially attributed to the former landfill and/or auto salvage facility to the east.

Based on a review of results from the Phase II ESA, petroleum impacts were detected in shallow soil and concentrations of metals and semi-volatile compounds were detected in groundwater along the northeast portion of the Site. These impacts were potentially attributed to nearby industrial uses including the former landfill, auto salvage and Leavenworth Service Center (also identified as the City Garage).

A Subsurface Exploration Report was also conducted for the proposed Price Chopper at Fourth & Marion Streets in October 1989. Miscellaneous rubble fill including gravel, brick, concrete, wood, metal and cinders were identified in borings advanced in the area of the proposed Price Chopper (north/northeast portion of the Site).

11.2 Regulated Sites Summary

The Site was not identified in the regulatory database searched by Environmental Data Resources, Inc. (EDR). The following facilities were identified within the approximate minimum search distance with potential for impact to the subject property:

A former landfill (City of Leavenworth Old City Landfill, City of Leavenworth 2nd & Limit Dump) was identified in the CITY DUMPS and SOLID WASTE FACILITY (SWF) databases and historically located north/northeast and cross-gradient to down-gradient of the Site. EWI interviewed Mr. Mike Gordon and Mr. Mike Hooper from the Public Works Department at the City of Leavenworth regarding their knowledge of the former landfill. Mr. Gordon and Mr. Hooper stated that to their knowledge the landfill was previously located north/northeast of the Site and was closed by approximately 1970 when the City Garage was developed in its place. Mr. Gordon and Mr. Hooper could not recall any sampling activities or investigation conducted at the landfill; although they could recall evidence of waste observed during construction activities onsite and the surrounding area. EWI submitted a records request to Kansas Department of Health and Environment (KDHE) for additional information on the former adjoining landfill. KDHE provided an inspection form for the landfill dated August 15, 2018. According to the inspection, the former landfill was in acceptable condition with no visible wastes. No violations were found. No information was available regarding sampling or investigation of the former landfill. Based on close proximity and the landfill's operation prior to environmental regulation, the facility is considered a REC and VEC to the Site.

Leavenworth, City of, Garage/City Garage/Leavenworth Municipal Garage Area was identified in the Superfund Enterprise Management System - Archive (SEMS-ARCHIVE), leaking underground storage tank (LUST), UST, Resource Conservation Recovery Act - Non Generator/No Longer Listed (RCRA-NONGEN/NLR) databases and was previously located northeast and cross-gradient to down-gradient of the Site at South 3rd and Marion Street. EWI requested documentation from KDHE and the City of Leavenworth regarding former operations and investigations at the facility. A LUST incident was reported for the facility in February 1991 in response to the removal of a 6,000-gallon fuel oil UST. A LUST incident was also reported in November 1992 when a 300-gallon waste oil UST and associated lines were removed from the facility. KDHE provided Buried Tank Leak Assessments (BTLAs) for both incidents and no leaking or contamination surrounding the USTs were reported; however, no sampling was conducted to confirm or deny impact to the subsurface. These incidents are closed. No information was provided regarding location of the former USTs. The facility has been listed as a non-generator since 2003 but was historically a small-guantity generator (SQG) in 1987 for benzene, tetrachloroethylene, spent non-halogenated solvents and ignitable waste. EWI reviewed a compliance inspection conducted at the facility in September 1991. The inspection identified employees disposing of paint waste and paint contaminated thinner by dumping the material on the ground north of the sign shop. Visibly contaminated soil was observed in this area. Evidence of waste paint and paint thinner was also observed being dumped into a storm drain near the sign shop which discharges to the east adjoining Fivemile Creek. In December 1991, soil samples were collected from 6 inches bgs and 18-24

inches bgs from six locations north of the sign shop. Based on a sampling map provided by KDHE, EWI determined that the sign shop was located approximately 135 feet northeast of the Site. The samples were composited into two samples (one 6 inch and one 18-24 inch sample) and analyzed for RCRA 8 metals, toxicity characteristic leaching procedure (TCLP) Organic Compounds and volatile organic compounds (VOCs). 1,1,2,2-tetrachloroethane, chlorobenzene and xylenes were detected at 19,000 parts per billion (ppb), 12 ppb and 28 ppb respectively in the composite sample collected from 6 inches bqs. No detections were identified in the sample from 18-24 inches bqs. KDHE determined that although contamination was present at the facility, it did not meet the definition of hazardous waste; therefore, areas of visible contamination was recommended to be removed and disposed. As of April 1992, approximately 60 cubic yards of contaminated soil was reportedly removed from the adjoining property and disposed of at the Leavenworth Landfill. No confirmation sampling appears to have been conducted following the soil removal from the facility. In addition, groundwater was not evaluated during the assessment. An additional complaint was issued for the facility in 1991 which noted oil contamination in the area of the vehicle maintenance garage. Based on a review of aerial photographs, the vehicle maintenance garage likely adjoined the Site to the northeast from at least 1970 to 1991. Vehicle storage is also depicted on the east portion of the Site in the 1985 aerial. Based on close proximity and a history of non-compliance, the City Garage formerly located on the northeast of the Site is considered a REC and VEC.

EWI also reviewed the following documentation for the Leavenworth Animal Control facility located northeast of the Site:

The City of Leavenworth provided a Field Report dated July 8, 2013 associated with the construction of the Leavenworth Animal Control (developed on the previous Leavenworth City Garage property). The report indicates that "tanks" were removed from the facility on July 2, 2013. Two of the tanks were reportedly "relocated to the northeast of the site", still on the City of Leavenworth's property. During this relocation, tank contents were reportedly spilled on the ground surface. The Field Report includes a photograph (on Page 4) that identifies "spillage" from the tank removal. The spillage appears to be northeast of the Price Chopper structure located on the subject property. A Field Report dated August 14, 2013 indicates that the tank spillage had not been cleaned up to date. In addition, tank spillage had previously been observed on standing water "north of the Price Chopper parking lot". The tanks removed during the construction of the Leavenworth Animal Control are potentially attributed to the former City Garage.

Great Western Manufacturing Co. adjoins the Site to the north and is located cross-gradient of the Site at 2017 South 4th Street and was listed as a SQG in 1993, 2000, 2003 and from 2005-2018. The facility was also listed as a large quantity generator (LQG) in 1994. The facility generates ignitable waste, chromium, benzene, methyl ethyl ketone, tetrachloroethylene, trichlorethylene and spent non-halogenated solvents. No violations have been reported. According to documentation provided, the facility manufacturers sieves and sifters used in the flour industry. KDHE provided documentation associated with a Hazardous Waste Compliance Assistance Visit (CAV) in 2012. Various deficiencies were cited during the visit; however, these do not appear to have impact on the subject property. EWI also reviewed historical inspections dated 1987 which indicate that waste paint and spent paint booth filters were historically being disposed of in the dumpster. At the time of the inspection, Safety-Kleen was disposing of waste solvent associated with onsite parts washing; however, correspondence states that the facility previously dumped waste solvent on the ground or in the trash. The timeframe associated with the practice of improper solvent dumping is unknown. Based on the close proximity of the facility and history of solvent dumping, the facility has potential to impact the subject property and is considered a REC and VEC.

Casey's General Store - #2826, located 100 feet west and up-gradient of the Site at 2100 South 4th Street currently utilizes a 20,000-gallon gasoline UST, a 12,000-gallon gasoline UST and a 8,000-gallon diesel UST installed in 2009. EWI submitted a request for additional information from KDHE and received documentation including registration and installation of the USTs. In addition, EWI reviewed correspondence dated June 29, 2010, August 3, 2010, July 12, 2011 in which KDHE noted that they had not received satisfactory inventory control records and/or monthly monitoring reports for release detection. Additional correspondence dated May 13, 2014, June 25, 2014, March 21, 2018, March 19, 2019, April 29, 2019 and May 20, 2019 indicate missing function tests for onsite USTs. EWI also reviewed UST inspections conducted by KDHE on November 4, 2011, March 28, 2013, April 18, 2017 and April 1, 2019 which indicated excess fluid in spill bucket. No other violations noted except for minor repairs. Although the facility has a history of missing compliance records, no releases or significant violations have been identified. Based on lack of identified releases, the facility does not pose a REC to the Site.

11.3 Site Reconnaissance Summary

The Site is currently occupied by a Price Chopper grocery store.

EWI observed three (3) underground grease traps present in the kitchen areas at the Site. According to Site Manager, Mr. Rory Knight, these grease traps are maintained by a third party on a regular basis. No issues were noted with the grease traps.

EWI observed a hydraulic box compactor in the back storage/stock area in the southeast corner of the structure. According to Mr. Knight, the machinery is maintained by a third party and he was not aware of any leaks or issues with the compactor. EWI also observed a trash compactor on the north side of the structure with oil staining on the equipment and asphalt beneath the compactor. The staining appeared to be minimal and no cracks in the asphalt or drains were observed in the area; on this basis, the staining is considered a de minimis condition.

EWI observed pole-mounted transformers throughout the Site. Three (3) pole-mounted transformers were observed on the northern property boundary, one (1) pole-mounted transformer was observed in the southwest corner of the Site, and four (4) pole-mounted transformers were observed south of the

Price Chopper structure. No decals were noted indicating PCB contents. No evidence of release was identified on the casings or ground beneath. In addition, EWI observed three (3) transformers on a platform east of the structure. EWI observed minor staining on the platform beneath the transformers. No evidence of release was observed on the ground beneath.

A receptacle labeled "used cooking oil" was located in the back storage/stock area in the southeast corner of the structure. According to Mr. Knight, the used cooking oil is picked up by a third party contractor on a regular basis.

During the Site reconnaissance, EWI observed an automotive salvage yard east of the Site. According to historical documentation, the automotive salvage yard, identified in the city directories as Lakes Auto Salvage, has adjoined the Site to the east since as early as 1963. Vehicle storage is also visible onsite in the 1966 and 1985 aerial photographs. Based on close proximity in addition to potential operation onsite, the automotive salvage yard is a REC and VEC to the Site.

12.0 CONCLUSIONS AND OPINIONS

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM E 1527-13 of the Price Chopper Property located at 2107 South 4th Street in Leavenworth, Leavenworth County, Kansas (the subject property or Site). The Vapor Encroachment Screening practices were conducted in accordance with ASTM E 2600-15. Any exceptions to, or deletions from, this standard are described in Section 10.0 of this report.

The following RECs and VECs were identified for the subject property during this assessment:

1. An automotive salvage yard, identified in the city directories as Lakes Auto Salvage, has adjoined the Site to the east since as early as 1963. Vehicle storage is also visible onsite in the 1966 and 1985 aerial photographs. Based on the close proximity in addition to potential operation onsite, the automotive salvage yard is considered a REC and VEC to the Site.

2. A former landfill (City of Leavenworth Old City Landfill, City of Leavenworth 2nd & Limit Dump) was previously located north/northeast of the Site and was closed by approximately 1970. No information was available regarding sampling or investigation of the former landfill. Based on close proximity and the landfill's operation prior to environmental regulation, the facility is considered a REC and VEC to the Site.

3. Leavenworth City Garage was previously located northeast of the Site at South 3rd and Marion Street. Various USTs have been removed from the facility with no information regarding location or sampling to confirm or deny impact to the subsurface. In addition, a history of non-compliance has been identified at the facility including visible oil contamination and disposing of paint waste and paint contaminated thinner on the ground and into a storm drain which discharges to the east adjoining Fivemile Creek. Although visibly contaminated soil was reportedly removed and disposed, no confirmation sampling appears to have been conducted following the removal of the contaminated soil. In addition, groundwater was not evaluated during the assessment. The area is currently occupied by Leavenworth Animal Control. A Field Report dated July 8, 2013 provided by the City of Leavenworth indicates that "tanks" were removed from the facility on July 2, 2013. Two of the tanks were reportedly "relocated to the northeast of the site", still on the City of Leavenworth's property. During this relocation, tank contents were reportedly spilled on the ground surface. Tank spillage had previously been observed on standing water "north of the Price Chopper parking lot". The tanks removed during the construction of the Leavenworth Animal Control are potentially attributed to the former City Garage. Based on close proximity and a history of non-compliance, the City Garage poses a REC and VEC to the Site.

4. Great Western Manufacturing Co. adjoins the Site to the north at 2017 South 4th Street. A historical inspection dated 1987 indicates that waste paint and spent paint booth filters were historically being disposed of in the dumpster at the facility. The facility also previously dumped

waste solvent on the ground or in the trash. The timeframe associated with the practice of improper solvent dumping is unknown. Based on the close proximity of the facility and history of solvent dumping, the facility has potential to impact the subject property and is considered a REC and VEC.

Based on a review of results from the 1989 Phase II ESA, petroleum impacts were detected in shallow soil and concentrations of metals and semi-volatile compounds were detected in groundwater along the northeast portion of the Site. These impacts were potentially attributed to nearby industrial uses including the former landfill, auto salvage and Leavenworth Service Center (also identified as the City Garage). In our opinion, additional investigation is recommended to evaluate the Site for subsurface impacts as a result of the RECs and VECs identified during this Phase I ESA.

13.0 QUALIFICATIONS OF THE PERSONNEL PARTICIPATING IN THIS PHASE I ESA

An environmental professional, according to ASTM E 1527-13, is a person meeting the education, training, and experience requirements as set forth in 40 CFR 312.10(b). All personnel assisting in the research, Site reconnaissance and composition of this Phase I ESA, who do not meet the definition of an environmental profession, worked under the direct supervision of the environmental professional.

We declare that, to the best of our professional knowledge and belief, we meet the definition of an Environmental Professional as defined in 312.10 of 40 CFR Part 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

14.0 SIGNATURES AND CERTIFICATIONS OF THE PERSONNEL RESPONSIBLE FOR THIS REPORT

We certify, by our signatures, the information submitted in this report to be true and accurate to the best of our knowledge. Resumes for these individuals are included as Appendix G of this report.

Scope of Work

ENVIRONMENTAL WORKS, INC. SCOPE OF WORK FOR PHASE I ENVIRONMENTAL ASSESSMENT (ASTM E 1527-13)

I. USER RESPONSIBILITIES

The user(s)/client(s) will be responsible for providing the following information:

a. Title records for information regarding past ownership, a legal description for the Site, environmental liens, land use limitations, site diagram, site contact information, completed client checklist, any environmentally related valuation reductions for the property, and reason for performing the Phase I ESA.

II. SITE RECONNAISSANCE

The site reconnaissance will include a visual survey of the accessible areas of the Site. The client will arrange for permission to enter and view the Site. The following activities are included:

- a. Attempt to interview persons familiar with the historical and current uses of the Site, including the current and/or previous owner, occupants, and potentially past and present employees and/or neighbors.
- b. Review of design drawings, as-built drawings, and site surveys, if available, for septic systems, storage tanks (underground and aboveground), storm drains, and sewer drains.
- c. Visual observations on the Site for evidence of historical and present use that may contribute to environmental risk. Observe conditions that suggest a past or potential release of hazardous substances and any chemical use, storage, treatment, or disposal practices which may have impacted the environment. Identify stressed vegetation, stained soils, surface impoundments, maintenance area, storage tanks, and other materials storage areas.
- d. Visual identification of equipment and structures that are commonly known to contain polychlorinated biphenyls (PCB's) including electrical and hydraulic equipment.
- e. Observation and description of current land uses on adjoining properties to assess potential environmental impacts to the Site.
- f. Observe adjacent properties for any items or actions which may adversely affect the Site.
- g. Photographs documenting the site reconnaissance will be included.

III. HISTORICAL RESEARCH

This task is intended to identify past ownership and land use that may be relevant in identifying potential environmental risks associated with the Site. The following may be included:

- a. Review of available aerial photographs that reflect prior uses of the Site and surroundings.
- b. Review of as many of the following sources as is necessary, available, and/or reasonably ascertainable: Sanborn Fire Insurance Maps, city directories, property tax files, USGS 7.5 minute Topographic Maps, building department records, zoning/land use records, recorded land title records or other historical resources for evidence of previous land use.
- c. Review of facility operational records to identify materials used, stored, and disposed during operations for the Site and at times the adjoining properties.

IV. AGENCY RECORDS REVIEW

a. Review of available pertinent federal, state and local government agency records which include, but are not limited to, these agencies:

Federal lists for the NPL, CERCLIS, RCRA CORRACTS, RCRA TSD, RCRA generators, UST, LUST, SPL, and ERNS (and their state equivalents) Missouri Department of Natural Resources (including Hazardous Waste and UST Offices) or their equivalents for other states Weights and Measures for aboveground storage tanks (for Missouri facilities) and its equivalent for other states Local Public Works, as applicable Local Fire Department Local Health Department (city and/or county offices), as applicable Local Utilities Other applicable agencies

b. Items researched for the subject property will include:

Storage tank registrations Hazardous waste generators Locations of abandoned and existing solid and hazardous waste landfills/dumps Pending or past enforcement actions against the Site Spills that have occurred on or near the Site Permits issued to the Site regarding environmental activities Wastewater discharge activities Water well locations/status

V. FINAL REPORT

A formal report will be prepared to address the following items:

- a. An executive summary, opinions, findings, conclusions, and recommendations of the study and applicable results.
- b. Complete description of activities conducted.
- c. A summary of information gathered from the site reconnaissance, historical research, and agency records review including past and present owners/operators/occupants; interview findings, and record findings.
- d. A summary of potential environmental risks discovered during the assessment. These may include recognized environmental conditions (RECs), controlled recognized environmental conditions (CRECs), historical recognized environmental conditions (HRECs), vapor encroachment conditions (VECs), and business environmental risks.

Phase I report content shall remain consistent with the ASTM E 1527-13 requirements. The Phase I report content will be updated in compliance with the latest standard of ASTM E 1527 as new versions are released and as applies to information dissemination.

EWI will provide the report electronically via Internet delivery unless other arrangements are made prior to the project deadline. EWI can also provide hard copies and/or copies on a compact disk (CD) of the report. Standard report delivery is through US Mail; additional fees may apply for alternate delivery means. Hard copies of the report will be available to the client for a fee of \$35 per copy.

Appendix B

User-Provided Information

ASTM E 1527-13 defines a *user* as a person seeking an environmental site assessment (ESA) of the subject property. A user may include, without limitation, a potential purchaser of the subject property, a potential tenant of the subject property, an owner of the subject property, a lender, or a Site manager.

The user has specific obligations for having an ESA completed as set forth in ASTM E 1527-13, Section 6. In accordance with that Section, this form requests information the client/user must provide to the environmental professional/consultant. *Note: if additional space is needed see page 3 and/or include separate documents.*

- Please provide information regarding the reason the Phase I ESA will be performed (may include due diligence, innocent landowner defense, business environmental risk, etc.).
 Due Diligence
- 2. Please describe the current use(s) of the subject property. **Grocery store**

3. Please describe the type of property transaction involved (refinance, purchase, sale, exchange, etc.). **Sale**

4. Please provide the complete and correct address of the subject property. If an address is not available for the subject property, please provide a map or other documentation showing the location and boundaries of the Site. <u>A legal description of the property is also required</u>.

2107 S 4th St, Leavenworth, KS 66048

5. Please provide information regarding any title search information, liens, and/or environmental cleanup liens on the subject property. If there are none, please state so.

Unknown

6. Please provide information regarding any activity and/or land use limitations (such as engineering or institutional controls) in place at the subject property. If there are none, please state so.

Unknown

7. Has the value of the subject property reduced below the price of comparable properties? If yes, please provide information regarding this reduction. Is the reason due to an environmental condition of the subject property? If so, please disclose any environmental information you have regarding the Site. This information may be important to the Environmental Professional/Consultant.

Unknown

 Please review the attached Scope of Work for the Phase I ESA, should any additions or deletions be required to meet your needs, provide the necessary information and the amendment(s) can be made. This Scope of Work, including any additions or deletions you require, will be included in the Phase I ESA report.

noted

9. Please identify all parties who will rely on/use the Phase I ESA and their (past, current, and future) relationship with the subject property. Please provide proper names and complete company names, etc.

Super market Developers, Inc

10. Please provide information regarding Site contact, owner information, and how each party can be reached.

Unknown

11. Please provide any special terms and conditions you require for the Phase I ESA. These terms and conditions must be agreed upon by the environmental professional/consultant and the client, <u>prior to project initiation</u>.

none

12. Please provide <u>any and all knowledge or experience</u> you have regarding the subject property. This may include past uses of the property, previous Environmental Assessments, documents, correspondence, chemicals currently or previously present at the site, and chemical spills or cleanups that have taken place at the subject property or its neighbors, or any other information regarding the Site and/or its environmental condition.

No knowledge of property

13. As the Phase I ESA User, based on your knowledge and experience related to the subject property, are there any obvious indicators that point to the presence or likely presence of contamination on the Site?

Unknown

14. EWI will provide the report electronically via Internet delivery. EWI can also provide hard copies of the final report. Hard copies are available at \$35.00 each. Please tell us how many copies of the report you prefer.

In addition, I would like 0 Hard Copies, at \$35 each.

I would like copies of the report in another format, as stated in the comments section on p 3.

15. **Please note:** Unless otherwise advised, EWI will include recommendations in the body of the text. I would like: (•) recommendations included in the report.

recommendations separate from the report.

)no recommendations.

Are additional documents attached to this Client Checklist?	Yes (🗩 N	ю
Please describe the attachments:	0	$\mathbf{\mathcal{I}}$	

Please describe any additional comments or further explanation to checklist questions:

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental St Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

Copyright 2019 by Environmental Data Resources, Inc. All rights reserved. Reproduction in any media or format, in whole or in part, of any report or map of Environmental Data Resources, Inc., or its affiliates, is prohibited without prior written permission.

EDR and its logos (including Sanborn and Sanborn Map) are trademarks of Environmental Data Resources, Inc. or its affiliates. All other trademarks used herein are the property of their respective owners.

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

2107 SOUTH 4TH STREET LEAVENWORTH, KS 66048

COORDINATES

Latitude (North):	39.2956710 - 39° 17' 44.41"
Longitude (West):	94.9076370 - 94° 54' 27.49"
Universal Tranverse Mercator:	Zone 15
UTM X (Meters):	335493.7
UTM Y (Meters):	4351114.5
Elevation:	779 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property. Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in *bold italics* are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/11/2019 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/25/2019 has revealed that there are 4 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

KS SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state

funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Health & Environment's list: Summary of Bureau of Environmental Remediation Sites in Kansas.

A review of the KS SHWS list, as provided by EDR, and dated 04/08/2019 has revealed that there are 5 KS SHWS sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

KS SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Department of Health & Environment's Directory of Sanitary Landfills, Solid Waste Transfer Stations and Collectors in Kansas.

A review of the KS SWF/LF list, as provided by EDR, and dated 04/01/2019 has revealed that there are 5 KS SWF/LF sites within approximately 0.5 miles of the target property.

KS CITY DUMPS: The City Dump Cleanup Program provides funds to cities or counties for the repair of old, unused municipal dump sites. These sites primarily operated between the 1940s and the 1970s before many counties had landfills and prior to the current regulations for solid waste disposal.

A review of the KS CITY DUMPS list, as provided by EDR, and dated 02/26/2019 has revealed that there are 5 KS CITY DUMPS sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/25/2019 has revealed that there are 4 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 2 EDR Hist Auto sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System

KS-FP (Kansas - Facility Profiler) is a geographically-based data warehouse site that presents information about facilities and locations of interest to the KDHE. This site has in excess of twenty environmental interest which contains information on closed facilities, completed cleanups, and past operations as well as data on current operations and activities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

purchased by Gould, Inc. and batteries were manufactured until 1984. GNB purchased Gould and continued battery manufacture until 1989 when the facility became a battery distribution center. In 1990 a Phase I Environmental Assessment was conducted and several potential contaminant sources were identified. Additional investigations detected VOCs and metals, primarily lead, contamination. The lead issue was addressed through the State Cooperative Program (C4-052-00022). The ground water impacts were addressed through the pilot Voluntary Cleanup Program. Additional ground water investigations have been conducted to delineate the extent of contamination. Exide Corporation purchased GNB Technologies on September 29, 2000. Exide submitted an application to the VCPRP on March 5, 2002 to complete investigation activities and initiate a remedial strategy.

Exide sold the GNB property to Tire Town in October 2002. A Volunta ry Agreement under the name DGS, LLC. (02VCP0037) was executed on December 12,

2002.

DGS submitted a Voluntary Cleanup Proposal to address the ground wat er contamination on October 24, 2003. KDHE requested revisions and discussions followed. KDHE, DGS and the City of Leavenworth explored the possibility of placing an Environmental Use Control on down gradient City property and conducting long term monitoring once an adequate monitoring well network is installed. To that effect, the City of Leavenworth submitted an EUC application in December 2005.

As of late 2010, the construction activities that previously postpon ed well installation were completed and a round of sampling was conducted of the existing wells in October 2010 to determine the need for and correct placement of additional wells. Results indicated the existing potential for contamination to impact the nearby Five Mile Creek. DGS planned to install an additional well cluster to evaluate this and KDHE would collect surface water samples from Five Mile Creek, per the VCI Work Plan approved on February 28, 2011. Surface water samples did not identify any contaminants above the laboratory detection limit.

Access to the downgradient City property in order to install the add itional well cluster was agreed upon in 2012. In a June 2013 meeting, The wells were installed and the monitoring network was sampled in January 2013. DGS agreed to one year of quarterly static water level measurements of the monitoring well network.

On March 19, 2015, KDHE approved a change to a monitoring frequency of every four years.

The facility was then purchased by Gould, Inc. and batteries were manufactured until 1984. GNB purchased Gould and continued battery manufacture until 1989 when the facility became a battery distribution center. In 1990 a Phase I Environmental Assessment was conducted and several potential contaminant sources were identified. Additional investigations detected VOCs and metals, primarily lead, contamination. The lead issue was addressed through the State Cooperative Program (C4-052-00022). The ground water impacts were addressed through the pilot Voluntary Cleanup Program. Additional ground water investigations have been conducted to delineate the extent of contamination. Exide Corporation purchased GNB Technologies on September 29, 2000. Exide submitted an application to the VCPRP on

March 5, 2002 to complete investigation activities and initiate a remedial

strategy.

Exide sold the GNB property to Tire Town in October 2002. A Volunta ry Agreement under the name DGS, LLC. (02VCP0037) was executed on December 12, 2002.

JUZ.

DGS submitted a Voluntary Cleanup Proposal to address the ground wat er contamination on October 24, 2003. KDHE requested revisions and discussions followed. KDHE, DGS and the City of Leavenworth explored the possibility of placing an Environmental Use Control on down gradient City property and conducting long term monitoring once an adequate monitoring well network is installed. To that effect, the City of Leavenworth submitted an EUC application in December 2005.

As of late 2010, the construction activities that previously postpon ed well installation were completed and a round of sampling was conducted of the existing wells in October 2010 to determine the need for and correct placement of additional wells. Results indicated the existing potential for contamination to impact the nearby Five Mile Creek. DGS planned to install an additional well cluster to evaluate this and KDHE would collect surface water samples from Five Mile Creek, per the VCI Work Plan approved on February 28, 2011. Surface water samples did not identify any contaminants above the laboratory detection limit.

Access to the downgradient City property in order to install the add itional well cluster was agreed upon in 2012. In a June 2013 meeting, The wells were installed and the monitoring network was sampled in January 2013. DGS agreed to one year of quarterly static water level measurements of the monitoring well network.

On March 19, 2015, KDHE approved a change to a monitoring frequency of every four years.

Narrative:	Facility manufactured lead batteries at this site since 1939.
	Facility produced approximately 3000 batteries per day. Plant employs
	150 people who work three shifts five days/week. Max 450 lbs of
	elemental lead disposed over 9.5 acres. Lead is present adhering to
	hard rubber battery casings buried as fill under the parking area
	onsite during late 1950s/early 1960s. Sulfuric acid stored in tanks
	on site and motor fuel also stored petroleum fuels in 4 underground
	tanks. A process wastewater discharge lagoon was also
	onsite.
	Investigation plan submitted December 12/91. Company is presently do
	ing some remediation (onsite) of lead contaminated soils. Follow up
	on remediation that is ongoing (12/92). GNB submitted to KDHE in
	October, 1992 a site investigation report. The site investigation
	report characterized the vertical extent of contamination.
	Investigation did not characterize the full lateral extent of
	contamination off site property. Investigation detected heavy metals
	lead (184,000 parts per million (ppm) and Toxicity Characteristic
	Leaching Procedure of 175 milligrams per liter (mg/l)); total
	petroleum hydrocarbons (TPH) (31,500 ppm) and volatile organic
	compounds (VOCs) and polycyclic aromatic hydrocarbons (PAHs) in soil.
	Investigation also detected heavy metals (lead, 238 micrograms per

liter (ug/l); beryllium, 22ug/l; and cadmium, 80 ug/l), VOC's (trichloroethylene (TCE), 3000 ug/l; 1,2-dichloroethane, 160 ug/l; and tetrachloroethylene (PCE), 8 ug/l) in groundwater. (10/93) KDHE has contacted GNB management requesting that all further investigative and remedial work be performed through a Consent Order with KDHE.

(10/93)

GNB submitted a work plan to remediate lead-contaminated surficial s oils by excavating and fixating. Certain on-site and off-site soils impacted by lead (>500 milligrams per kilogram (mg/kg)) will be remediated in order to facilitate a plant expansion behind (east) of the plant. Fixated soil will be used as fill material to build a level parking area accomodating tractor-trailer parking and on/off-loading of inventory (3/95). A Letter Agreement was signed on January 11, 1995 for remediation of lead contaminated soils. Soil fixation approximately 80% completed (11/95).

Site management of groundwater issues only has been transferred to K DHE's pilot Vountary Clean-up Program (VCP) (KDHE Project No. C4-052-70061). The pilot Voluntary Agreement is 95-V-0002 and was executed on April 27, 1995. The pilot Voluntary Agreement was terminated when DGS, LLC assumed environmental responsibiliy for existing groundwater impacts (KDHE Project No. C4-052-70061).

On June 20, 1997, KDHE approved soil remediation/stabilization and asphalt cap and soil/vegetation cover over treated soils. June 30, 1999, the grading, capping, and paving at the site was completed. KDHE approved lead affected soil remediation and site restoration closure report of September 13, 1999. On January 3, 2000, KDHE terminated the letter agreement for lead contaminated soil remediation/stabilization

activities.

As agreed, the second component of the approved remedial strategy w as the enactment of deed restrctions to address the lead contamination remaining on the property. The deed restriction component was never enacted; therefore, this project is being re-opened via a September 8, 2003, letter to DGS, LLC, the current property owner and the entity that assumed environmental liability for this project.

DGS will participate in the EUC Program to address soil contaminatio n remaining at the property. The EUC application was submitted to KDHE on October 2, 2003 and the EUC Agreement executed on November 17, 2004. The latest inspection in March 2012 noted general compliance with the EUC Agreement noting the need to address animal burrowing into the cap.

Activity Start Date:	09/22/1999
Activity End Date:	10/07/1999
Narrative:	Facility manufactured lead batteries at this site since 1939.
	Facility produced approximately 3000 batteries per day. Plant employs
	150 people who work three shifts five days/week. Max 450 lbs of
	elemental lead disposed over 9.5 acres. Lead is present adhering to
	hard rubber battery casings buried as fill under the parking area
	onsite during late 1950s/early 1960s. Sulfuric acid stored in tanks
	on site and motor fuel also stored petroleum fuels in 4 underground
	tanks. A process wastewater discharge lagoon was also
	onsite.
	Investigation plan submitted December 12/91. Company is presently do
	ing some remediation (onsite) of lead contaminated soils. Follow up
	on remediation that is ongoing (12/92). GNB submitted to KDHE in
	October, 1992 a site investigation report. The site investigation
	report characterized the vertical extent of contamination.
	Investigation did not characterize the full lateral extent of
	contamination off site property. Investigation detected heavy metals
	lead (184,000 parts per million (ppm) and Toxicity Characteristic
	Leaching Procedure of 175 milligrams per liter (mg/l)); total
	petroleum hydrocarbons (TPH) (31,500 ppm) and volatile organic
	compounds (VOCs) and polycyclic aromatic hydrocarbons (PAHs) in soil.
	Investigation also detected heavy metals (lead, 238 micrograms per
	liter (ug/l); beryllium, 22ug/l; and cadmium, 80 ug/l), VOC's
	(trichloroethylene (TCE), 3000 ug/l; 1,2-dichloroethane, 160 ug/l;
	and tetrachloroethylene (PCE), 8 ug/l) in groundwater. (10/93) KDHE
	has contacted GNB management requesting that all further
	investigative and remedial work be performed through a Consent Order
	with KDHE.
	(10/93)
	GNB submitted a work plan to remediate lead-contaminated surficial s

oils by excavating and fixating. Certain on-site and off-site soils impacted by lead (>500 milligrams per kilogram (mg/kg)) will be remediated in order to facilitate a plant expansion behind (east) of the plant. Fixated soil will be used as fill material to build a level parking area accomodating tractor-trailer parking and on/off-loading of inventory (3/95). A Letter Agreement was signed on January 11, 1995 for remediation of lead contaminated soils. Soil fixation approximately 80% completed (11/95).

Site management of groundwater issues only has been transferred to K DHE's pilot Vountary Clean-up Program (VCP) (KDHE Project No. C4-052-70061). The pilot Voluntary Agreement is 95-V-0002 and was executed on April 27, 1995. The pilot Voluntary Agreement was terminated when DGS, LLC assumed environmental responsibility for existing groundwater impacts (KDHE Project No. C4-052-70061).

On June 20, 1997, KDHE approved soil remediation/stabilization and asphalt cap and soil/vegetation cover over treated soils. June 30, 1999, the grading, capping, and paving at the site was completed. KDHE approved lead affected soil remediation and site restoration closure report of September 13, 1999. On January 3, 2000, KDHE terminated the letter agreement for lead contaminated soil remediation/stabilization

activities.

As agreed, the second component of the approved remedial strategy w as the enactment of deed restrctions to address the lead contamination remaining on the property. The deed restriction component was never enacted; therefore, this project is being re-opened via a September 8, 2003, letter to DGS, LLC, the current property owner and the entity that assumed environmental liability for this project.

DGS will participate in the EUC Program to address soil contaminatio n remaining at the property. The EUC application was submitted to KDHE on October 2, 2003 and the EUC Agreement executed on November 17, 2004. The latest inspection in March 2012 noted general compliance with the EUC Agreement noting the need to address animal burrowing into the cap.

MIDLAND FUMIGANTS (Continued)

conducted by EPA at Midland between 1999 and 2004. EPA issued a Unilateral Administrative Order (UAO) in April 2005 pursuant to CERCLA and RCRA to compel Midland to complete disposal of the fumigant products stored at the site that were not reusable. The final disposal occurred on December 27, 2007, of 34,827 pounds of aluminum phosphide. A joint EPA RCRA and CERCLA inspection was conducted during packaging of the final shipment in November 2007, that found site conditions to be satisfactory regarding the UAO.

During the PA, three ground water and eight soil samples were obtain ed at the site. Arsenic was identified in S-1 above residential RSK levels but within regional background levels. Phosphorus was identified above three times background in three samples but these did not have associated elevated detections of aluminum. Ground water indicated trace levels of volatile organic compounds (VOCs) both in the up- and down-gradient samples below RSK levels. The Midland site does not appear to be a significant source of contamination to soils or ground

water.

Since removal action activities have been completed, and a significa nt release of hazardous substances, pollutants or contaminants was not identified at the Midland site, a qualifier of ?no further remedial action planned? (NFRAP) appears to be appropriate. The site is recommended to be entered with an ?N? qualifier. Additional RCRA documentation requirements may be present in the UAO that are the responsibility of Midland under the UAO.

Sonny Hill car dealership. In 1989 KDHE sent a letter to the property owner, David Block, instructing him to address visible contamination at the site. The contamination appeared to be emanating from an old storm sewer or septic tank outfall into a nearby drainage ditch. Oil and petroleum wastes were being released from the storm/septic sewer pipe. At the time of the letter, the property was being leased by Sonny Hill Autos as a car lot and repair facility.

Upon a more detailed file review, this site area is presently includ ed within the Sonny Hill Jeep/Eagle Voluntary Cleanup and Property Redevelopment Program (VCPRP) site. A phased Voluntary Cleanup Investigation (VCI) is underway at the site which includes addressing the surface water discharge.

Since this site is part of an existing active VCPRP site, it appears no further site assessment is necessary under the Comprehensive Environmental Response, Compensation and Liabilities Act (CERCLA). This site does not appear in the active or archived list of CERCLA sites.

Not reported Septic Tank, Other (see Site Narrative) Commercial, Industrial Not reported BMD PROPERTY; SONNY HILL MOTORS - LEAVENWORTH Not reported Not reported Voluntary Cleanup Proposal Proposed 05/24/2006 Not reported Mr. Bob Mitchell, the Managing Partner with JDM Properties, LLC, submitted an application to the VCPRP on April 3, 2002. The future use of the property will be equipment rental. At the time of VCPRP application, the property was vacant.

The contamination on the site was discovered during a site investiga tion conducted in 1990. Petroleum hydrocarbons and chlorinated volatile organic compounds (VOC?s) were found in soils and groundwater. Additionally, there is a storm drain inlet point near the northeast corner of the site which ultimately discharges into a nearby creek. Oil was found in the creek which resulted in the installation of a low flow oil/water separator and a multiple baffled weir in the sewer inlet and outlet. The contamination source was an improperly used septic tank which has been removed from the property.

Property was accepted into VCPRP on 05/08/02. Additional subsurface investigation was conducted in September 2002 for delineation of contamination in groundwater and soil. Report of investigation results received by KDHE 11/19/02. Requests were made by KDHE for additional delineation efforts in January and May of 2003. In June of 2003, the voluntary party sent documentation to KDHE requesting an extension for the work requested by KDHE due to financial hardship. In October of 2003, KDHE contacted the Voluntary Party for a status on the

property.

The demonstration of financial hardship is pending. The results that were received in Feb. 2006 for the latest groundwater sampling indicated that contaminants are decreasing and are not leaving the property. The site is ready to enter into the cleanup phase. Delineation of groundwater and soil contamination has been achieved

and KDHE has requested a VC Proposal.

A new voluntary agreement was executed 4/4/2012. Additional groundw ater sampling conducted. Latest groundwater monitoring report approved December

2013.

1075

The Voluntary Party has requested to terminate the Voluntary Agreeme nt. Terminated agreement on 09/10/2015.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/11/2019 Date Data Arrived at EDR: 04/18/2019 Date Made Active in Reports: 05/14/2019 Number of Days to Update: 26 Source: EPA Telephone: N/A Last EDR Contact: 07/02/2019 Next Scheduled EDR Contact: 10/14/2019 Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991 Date Data Arrived at EDR: 02/02/1994 Date Made Active in Reports: 03/30/1994 Number of Days to Update: 56 Source: EPA Telephone: 202-564-4267 Last EDR Contact: 08/15/2011 Next Scheduled EDR Contact: 11/28/2011 Data Release Frequency: No Update Planned

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/11/2019 Date Data Arrived at EDR: 04/18/2019 Date Made Active in Reports: 05/14/2019 Number of Days to Update: 26 Source: EPA Telephone: N/A Last EDR Contact: 07/02/2019 Next Scheduled EDR Contact: 10/14/2019 Data Release Frequency: Quarterly

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 04/03/2019 Date Data Arrived at EDR: 04/05/2019 Date Made Active in Reports: 05/14/2019 Number of Days to Update: 39 Source: Environmental Protection Agency Telephone: 703-603-8704 Last EDR Contact: 07/03/2019 Next Scheduled EDR Contact: 10/14/2019 Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

MO BROWNFIELDS: Brownfields Site List

Brownfields are sites where redevelopment and reuse is hampered by known or suspected contamination with hazardous substances. While many brownfield sites are minimally contaminated, potential environmental liability can be a problem for owners, operators, prospective buyers and financial institutions. Because of the large number of these sites, their economic impact especially in heavily industrial areas is substantial.

Date of Government Version: 04/02/2019 Date Data Arrived at EDR: 05/14/2019 Date Made Active in Reports: 07/18/2019 Number of Days to Update: 65 Source: Department of Natural Resources Telephone: 573-526-8913 Last EDR Contact: 05/14/2019 Next Scheduled EDR Contact: 08/26/2019 Data Release Frequency: Quarterly

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

Date of Government Version: 08/30/2013 Date Data Arrived at EDR: 03/21/2014 Date Made Active in Reports: 06/17/2014 Number of Days to Update: 88 Source: Environmental Protection Agency Telephone: 617-520-3000 Last EDR Contact: 05/06/2019 Next Scheduled EDR Contact: 08/19/2019 Data Release Frequency: Quarterly

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

Date of Government Version: N/A Date Data Arrived at EDR: N/A Date Made Active in Reports: N/A Number of Days to Update: N/A Source: EDR, Inc. Telephone: N/A Last EDR Contact: N/A Next Scheduled EDR Contact: N/A Data Release Frequency: No Update Planned

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services,

a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary

and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

2107 SOUTH 4TH STREET 2107 SOUTH 4TH STREET LEAVENWORTH, KS 66048

TARGET PROPERTY COORDINATES

Latitude (North):	39.295671 - 39° 17' 44.42''
Longitude (West):	94.907637 - 94° 54' 27.49"
Universal Tranverse Mercator:	Zone 15
UTM X (Meters):	335493.7
UTM Y (Meters):	4351114.5
Elevation:	779 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5687559 LEAVENWORTH, KS
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

- 1. Groundwater flow direction, and
- 2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

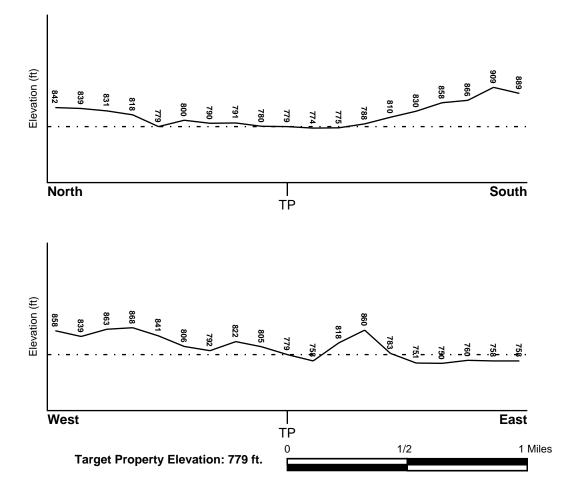

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
29165C0270D	FEMA FIRM Flood data
Additional Panels in search area:	FEMA Source Type
Not Reported	
NATIONAL WETLAND INVENTORY	

	NWI Electronic
NWI Quad at Target Property	Data Coverage
LEAVENWORTH	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

MAP ID

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

Not Reported

LOCATION

FROM TP

GENERAL DIRECTION GROUNDWATER FLOW

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1	
Soil Component Name:	Judson
Soil Surface Texture:	silt loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained
Hydric Status: Partially hydric	
Corrosion Potential - Uncoated Steel:	Moderate
Depth to Bedrock Min:	> 0 inches
Depth to Watertable Min:	> 0 inches

	Soil Layer Information						
	Bou	Indary		Classification		Saturated hydraulic	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	conductivity micro m/sec	Soil Reaction (pH)
1	7 inches	29 inches	silt loam	Not reported	Not reported	Max: 14.11 Min: 4.233	Max: 7.3 Min: 5.6
2	29 inches	50 inches	silty clay loam	Not reported	Not reported	Max: 14.11 Min: 4.233	Max: 7.3 Min: 5.6
3	50 inches	70 inches	silt loam	Not reported	Not reported	Max: 14.11 Min: 4.233	Max: 7.3 Min: 5.6
4	0 inches	7 inches	silt loam	Not reported	Not reported	Max: 14.11 Min: 4.233	Max: 7.3 Min: 5.6

Soil Map ID: 2	
Soil Component Name:	Ladoga
Soil Surface Texture:	silt loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Source: FEMA Telephone: 877-336-2627 Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory Source: US Fish & Wildlife Service Telephone: 703-358-2171

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS) The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS) Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Dear Mr. White:

Enclosed herein is Terracon Environmental's report on the shallow soils and groundwater assessment performed at the proposed Supermarket site located in Leavenworth, Kansas. This limited intrusive assessment was performed as a result of information obtained during a previous Phase I assessment of the site. The primary focus of this work was to assess subsurface conditions to help determine whether potential off-site contaminant sources may have adversely impacted the area of study.

We appreciate the opportunity to be of service to Four B Corporation on this project. If there are any questions concerning this report, or if we may be of further service to you, please do not hesitate to contact us at 816/891-7717.

Sincerely,

TERRACON ENVIRONMENTAL, INC.

ENVIRONMENTAL ASSESSMENT - PHASE II PROPOSED SUPERMARKET SITE LEAVENWORTH, KANSAS PROJECT NO. 50895161

1.0 INTRODUCTION

1.1 Background

This report presents the results of an intrusive environmental assessment of the tract of land located at the northeast corner of 4th and Marion Street in Leavenworth, Kansas. The assessment was completed in accordance with our proposal dated November 14, 1989.

1.2 Project Objective and Scope of Services

Information obtained during a Phase I environmental assessment of the subject property revealed that potential contaminant sources exist to the north, east and southeast of the site. As such, the intrusive assessment activities were designed to assess for potential shallow soil and groundwater contamination on the site as a result of possible migration from these off-site sources. The scope of work for this assessment included the following activities:

- installation of six groundwater monitor wells located along the perimeter of the property;
- field characterization of soil samples collected from each of the six monitor well boring locations;
- laboratory analysis of shallow soil samples collected from two monitor well boring locations;
 - Iaboratory analysis of groundwater collected from the monitor well locations;
 - collection of three discrete shallow soil samples along the east property line for total petroleum hydrocarbon and lead analysis; and,
 - ^o a final report detailing the work performed and summarizing the results.

Terracon

2.0 SITE DESCRIPTION

Two houses, a furniture store and two small sheds are located on the site. However, the subject property is primarily undeveloped with a majority of the site being tree and grass covered. An unimproved road, referred to as Third Street, runs through the center of the site allowing access to properties to the north. An abandoned railroad line is evident running along the east side of Third Street. Attached as Figure 1 is a site diagram.

The property slopes very gradually from the west to the east with approximately a six foot drop in elevation across the site. Surface drainage is generally to the east toward Five Mile Creek. Where the site is divided by 3rd Street, drainage is directed south toward Marion Street.

2.1 General Area

d m

Adjacent properties to the north of the site include Great Western Manufacturing, GNB Batteries, and the Leavenworth Service Center (former landfill). Property to the east and the southeast is occupied by an auto salvage yard, and automobile repair shops are located south of the property. To the west of the site, across Fourth Street, are light commercial and residential properties. A more detailed discussion of the surrounding area, including a review of historical site ownership, environmental regulatory correspondence and site photographs are contained in the initial Phase I assessment report issued on October 27, 1989.

Terracon

3.0 SOILS EXPLORATION

Based on the information obtained during the Phase I assessment of the property regarding potential off-site contaminant sources, Terracon Environmental conducted a limited scope soils exploration along the east property line and near the northeast corner of the site. This was performed in an effort to identify possible lead and/or petroleum contamination. As was reported in the Phase I assessment dated October 27, 1989, it is Terracon's understanding that underground fuel storage tanks on the Leavenworth Service Center property previously leaked an undetermined amount of gasoline. For this reason, and due to the long history of auto salvage activities east of the property, the soils exploration was conducted in this area.

3.1 Shallow Soils Sampling and Analysis

Three discrete shallow soil samples were collected on November 20, 1989, near what is considered the eastern property line. The samples were collected from a depth of approximately 2 feet below surface at three discrete locations along the east side of the fence bordering the auto salvage yard.

The samples were collected using a hand auger sampler which was cleaned with an Alconox detergent wash and rinse between borings to help prevent cross contamination. Laboratory analysis did not reveal total petroleum hydrocarbon levels in either of the three samples above a detection limit of 50 parts per million (ppm). Total lead was detected at concentrations of approximately 20 ppm in each of the three samples. Typical backgound levels for lead

in this area are between 15 and 70 ppm¹; therefore, these concentrations can be considered in the typically observed range.

3.2 MW-3 and MW-4 Soils Sampling and Analysis

In an effort to identify shallow petroleum hydrocarbon contamination near the location of the underground fuel storage tanks on the Leavenworth Service Center property, soil samples were collected from the MW-3 and MW-4 boring locations. A discrete soil sample was collected from each boring at the 3 foot below surface depth and submitted to the laboratory for total petroleum hydrocarbon (TPH) analysis.

The results indicate TPH at a concentation of 140 ppm in the 3 foot depth sample from MW-3, and 260 ppm in the 3 foot depth sample from MW-4. These elevated levels in the shallow soils may be the result of previous gasoline spillage associated with fuel loading practices, and in part may be attributed to degradation of organic matter contained in the fill material in this boring. It is important to note that no volatile organic constituents of gasoline (i.e. benzene, toluene, and ethylbenzene) were detected in a previous composite soil sample collected from this area during the Phase I assessment. Also, the results of the groundwater sample collected from MW-3 and MW-4 did not detect the presence of benzene, toluene or xylene. Although the concentrations of TPH detected in the 3 foot soil samples from MW-3 and MW-4 are above what would be considered typical background concentrations, an evaluation of all the data does not suggest that this is indicative of a serious or widespread environmental concern.

Jon J. Connor and Hansford T. Shacklette, <u>Background</u> <u>Geochemistry of Some Rocks, Soils, Plants and Vegetables in</u> the Conterminuous United States, (Washington, 1975) p. F84.

Terracon

Terracon

4.0 GROUNDWATER EXPLORATION

To assess groundwater quality at the site, Terracon conducted an intrusive exploration along the perimeter of the property. The intrusive assessment consisted of the drilling and installation of six monitor wells along the perimeter of the site to better determine whether potential off-site contaminant sources may have impacted the subject property. Three wells were installed along the north property line, two wells were installed along the east property line and one well was installed near the southwest corner of the property. See Figure 1 for monitor well locations.

4.1 Drilling Activities

Terracon Environmental installed six groundwater monitor wells at the site on November 20 and 21, 1989. Field operations for the drilling phase of the monitor well installation was performed by a three-man drill crew using hollow stem augers and a rotary drill rig. Prior to the exploration, the working end of the rig was detergent washed using a high pressure, hot water sprayer. During drilling, lead augers and downhole sampling equipment were cleaned between borings to reduce the potential for cross contamination.

The strata was field logged based upon visual classification. The soils encountered in the boreholes consisted primarily of clay and silty clay, with fill material noted in borings MW-3, MW-4 and MW-5. The fill material was presumably used to backfill the former Five Mile Creek channel which, prior to 1968, looped to the west of its present course and across the northeast portion of the

Terracon

property. At the time of drilling, water was observed in all six borings. In MW-1 and MW-5, water was detected at approximately 18 feet below surface. In MW-2, MW-3, MW-4 and MW-6 water was detected at approximately 13 feet below surface. Boring logs are attached as Appendix I.

4.2 Field Characterization

During drilling, soil samples were collected from each boring at approximately the 3 foot and 10 foot depth, where possible, for field screening. Samples were placed in one-quart glass jars approximately one-half full, covered with aluminum foil, and allowed to volatilize at ambient conditions for a minimum of fifteen minutes. A photoionization detector (PID) was then used to analyze air contained in the headspace of the jar for chemical contamination. The PID is an instrument used to provide field characterization for the limited quantitative identification of a broad range of organic vapors based upon a relative instrument standard.

Readings from the PID for samples across the site did not exceed 0.7 ppm, except for the 3 foot sample collected from MW-3 which registered a level of just less than 200 ppm. No sample was recovered at the 10 foot depth while drilling MW-3 due to fill material which plugged the continuous sampling equipment. The elevated headspace reading in this boring is consistent with an organic odor noted during drilling. No other elevated readings were detected with the PID during field characterization of the soils.

It is also important to note that field characterization did not reveal elevated volatiles contamination (benzene, toluene, xylene) in any of the samples collected from this general area during the previous Phase I assessment work.

Terracon

4.3 Well Installation and Development

The well materials consist of two-inch nominal diameter, Schedule 40 PVC, flush-jointed, threaded pipe. Factory slotted 0.01 inch well screen was installed at the bottom of each borehole and extended to intersect the water table based upon water levels encountered during drilling. A 15 foot section of slotted screen was used for MW-2 and MW-5, and a 20 foot section of slotted screen was used for MW-1, MW-3, MW-4 and MW-6. Solid stem PVC riser pipe was attached to each of the screened sections and extended approximately 2.5 feet above ground surface.

The borehole annulus was packed with a fine sand from the bottom of the borehole to a point approximately one foot above the slotted well screen. An approximate one to two foot thick layer of hydrated bentonite pellets was installed in the borehole annulus above the sand pack. The remaining annulus was filled to ground surface with a cement/bentonite grout mixture. Upon completion, the well heads were secured within protective metal casings which rise approximately 3 feet above ground surface, and locked with keyed-alike padlocks. Figure 2 shows a typical monitor well design. Specific well diagrams for MW-1 through MW-6 are included on the boring logs in Appendix II.

Well development was performed by Terracon Environmental personnel using individual disposable bailers. The wells were considered developed when approximately three standing water volumes were removed from each casing. Development fluids were not collected.

Terracon

4.4 Sampling Procedures and Analysis

Groundwater samples were collected from the monitor wells on November 24, 1989. The samples were obtained using individual disposable bailers and placed in preserved sample containers. The samples were cooled, packaged, and shipped via Federal Express to Continental Analytical Services in Salina, Kansas. Samples obtained from monitor wells 1 through 5 were analyzed for benzene, toluene and xylene (BTX). Additionally, samples collected from monitor wells MW-1, MW-2, MW-3 and MW-5 were analyzed for total lead.

The BTX and lead analyses were designed to identify potential migration of petroleum products and/or lead from sources to the north and east (i.e. GNB Batteries, City Maintenance Garage, Auto Salvage Yard). Samples collected from monitor wells MW-3, MW-4, MW-5 and MW-6 were subjected to a survey search for extractable compounds (semi-volatile compounds) and volatile organic compounds. This analysis is designed to identify organic compounds present as a result of former landfill activities adjacent to the site and fill material on the property. Finally, samples collected from monitor wells MW-4 and MW-6 were analyzed for the 13 priority pollutant metals. Elevated metals concentrations could be expected due to landfill and salvage yard activities, as well as other nearby industrial sites.

4.5 Analytical Results

Analytical results for MW-1, MW-2, MW-3 and MW-5 revealed no detectable concentrations of benzene, toluene, xylene or total lead. Also, results for MW-3, MW-5 and MW-6 identified no volatile or semi-volatile compounds above a detection limit of approximately 5 parts per billion (ppb).

The concentrations of metals detected in MW-6 were either at the detection limit or below detection limits. However, the analytical results for MW-4 revealed elevated levels of some metals, compared to the results for MW-6, and a concentration of 18 ppb for an unidentified semi-volatile compound found to be present during the survey search analyses. In some instances, the concentrations of metals are above those established as maximums for drinking water standards. The table below lists the metals concentrations in mg/l or part per million (ppm) for MW-4 and MW-6, and includes their respective National Drinking Water Standard.

	<u>MW-4</u>	<u>MW-6</u>	*National Drinking Water Standards
Arsenic	0.06	<0.01	0.05
Cadmium	0.97	<0.01	0.010
Chromium	0.17	<0.04	0.05
Copper	0.52	<0.05	1.0
Lead	3.0	<0.003	0.05
Nickel	0.28	<0.05	
Zinc	7.45	0.01	5.0

* Reference: 40 CFR 141 and 143

The metals results from MW-4 suggest that there has been some impact to the groundwater in this vicinity. The probable source or sources are the former landfill to the north of the site and the auto salvage yard to the east. An EPA study conducted in 1984 of the former landfill site involved analytical testing of water from nearby Five Mile Creek. (The creek runs to the east of the former landfill and the salvage yard.) Results of the EPA study found that elêvated metals concentrations were present in Five Mile Creek, and that this may be due in part to the former

Terracon

Terracon

landfill, the auto salvage yard and/or other industrial properties in the area. EPA concluded in their study of 1984, that the former landfill site 'poses no threat to the surrounding environment.'

The metals concentrations detected during our assessment were found to be less than those reported by EPA during their nearby study. Although the metals concentrations from MW-4 are elevated with respect to what may be considered typical of groundwater in the area (as indicated by the analytical results from MW-6), the groundwater at this location is not utilized as a drinking water source.

5.0 SUMMARY AND CONCLUSIONS

No indication of petroleum-based contamination was detected in the shallow groundwater as a result of sampling for benzene, toluene and xylene. Additionally, the results of screening for a broad range of volatile and extractable compounds via a mass spectral survey search found nothing which would indicate a serious or widespread environmental contamination problem exists in the shallow groundwater at this site.

Analysis of shallow soils from MW-3 and MW-4 indicate that a localized area of relatively low-level petroleum hydrocarbon contamination may exist near the northeast portion of the property. However, the concentrations detected do not suggest that a serious or widespread environmental concern exists.

Based upon a review of the analytical data which has been collected by both EPA and Terracon, it appears that off-site contaminant sources may have impacted the shallow groundwater

near the northeast portion of the subject property. Elevated levels of certain metals detected in MW-4 are above National Drinking Water Standards; however, at this time the groundwater at this location is not utilized as a drinking water source. An EPA study performed in 1984, found elevated levels of aluminum, barium, copper, iron, lead magnesium, manganese, mercury, nickel and vanadium in the Five Mile Creek samples downstream of the former landfill and auto salvage yard properties. The EPA study concluded that based on the analytical results from samples collected from Five Mile Creek, no threat to the surrounding environment is expected. Terracon recommends that the monitor wells be retained at this site to provide sampling points should future groundwater monitoring be desired.

6.0 GENERAL COMMENTS

The analysis and comments presented in this final report are based upon data obtained from the shallow soil and groundwater assessment activities performed as part of the work scope, and other information collected by Terracon as described herein. Please note that this report does not reflect any variations of subsurface stratigraphy or environmental contamination which may exist between borings or across the site. Actual subsurface conditions may vary, and the extent of such variations may not become evident without further investigation. If variations appear evident, it will be necessary to reevaluate the comments contained in this report.

This report is prepared in accordance with generally accepted engineering practices within the constraints of the client's directives. The report is intended for the

Terracon

Terracon

exclusive use of the client for specific application to the assessed property. No other warranty is expressed or implied.

RE: Subsurface Exploration Report Proposed Supermarket Fourth & Marion Streets Leavenworth, Kansas Job No. 02897029

Gentlemen:

We have completed the subsurface exploration for the referenced project. The accompanying geotechnical report presents the findings of the subsurface exploration and our recommendations concerning the design and construction of foundations and pavements.

In summary, drilled pier foundations are recommended for support of the proposed supermarket; miscellaneous poorly compacted fill and soft, compressible native soils were encountered during the subsurface exploration. Recommendations for support of a future building to be constructed near the northwest corner of the site on footing foundations is also included. Results of the concurrent environmental study are being submitted under separate cover.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report, or if we may be of further service to you in any way, please do not hesitate to contact us.

Sincerely,

TERRACON CONSULTANTS SE, INC.

SUBSURFACE EXPLORATION REPORT PROPOSED SUPERMARKET FOURTH & MARION STREETS LEAVENWORTH, KANSAS

Job No. 02897029 October 26, 1989

INTRODUCTION

The subsurface exploration for the proposed supermarket in Leavenworth, Kansas, has been completed. Twenty-one borings extending to depths of 8 to 42.8 feet below existing ground surface were performed. Individual boring logs and a location diagram are included with this report.

The proposed project will consist of a single-story structure with a relatively high roof. A basement for the structure is not planned, but tunnels 4 to 5 feet below floor level will be needed for refrigeration piping and other utilities. The proposed building will enclose approximately 48,000 square feet. Column loads are estimated to range from 50 to 160 kips; wall loads are anticipated to be 4 to 5 kips per lineal foot. Floor loads are anticipated to be relatively light except where heavy freezer units are located.

Parking for 290 vehicles is planned on the west portion of the project site. Entrances to the proposed supermarket from Fourth Street on the west and Marion Street on the south are planned. Loading dock facilities are planned along the east side of the proposed building.

Based upon our interpretations of the existing site grades, we estimate that the construction of the building pad may require approximately 3 feet of fill to provide drainage away from the structure. Minor cuts and fills are expected over the remainder of the proposed project site. Recommendations for site preparation and fill placement are provided in this report.

The purpose of this report is to describe the subsurface conditions encountered in the borings, present all test data, and make recommendations regarding foundation design and construction.

-1-

The borings were performed between September 29 and October 4, 1989, with a truck-mounted rotary drill rig equipped with a hydraulic head employed in drilling and sampling operations. The boreholes were typically advanced using continuous flight augers; however, hollow stem augers were used at Boring B-11 to maintain stability of the borehole through the fill and soft subsurface soils encountered. Representative samples were obtained by thin-walled tube sampling procedures in accordance with ASTM Specification D-1587. In the tube sampling procedure, a thin-walled seamless steel tube with a sharp cutting edge is pushed hydraulically into the ground to obtain relatively undisturbed samples of cohesive or moderately cohesive soils. Tubes with a nominal 2 inch O.D. were typically used to obtain samples of the subsurface soils; 3 inch 0.D. steel tubes were used to obtain samples of soft cohesive soils. In addition, split-barrel sampling procedures, ASTM Specification D-1586, were used at Boring B-11 within the existing fill material. In the split-barrel sampling procedure, a standard 2 inch 0.D. split-barrel sampling spoon is driven into the ground with repeated blows of a 140 pound hammer falling a distance of 30 inches. The number of blows required to advance the sampling spoon the last 12 inches of a normal 18 inch penetration is designated as the standard penetration resistance value. These values are indicated on the boring log at the depth of occurrence and are an indication of the relative consistency of the existing fill materials. All samples were sealed and returned to the laboratory for testing and classification.

Field logs of each boring were prepared by the drill crew. These logs contained visual classification of the materials encountered during drilling as well as the driller's interpretation of the subsurface conditions between samples. Final boring logs included with this report represent the engineer's interpretation of the field logs and may include modification based on laboratory observation and tests of the samples.

Borings B-1A, B-3, B-10A, B-11, and B-12 were drilled to an apparent limestone bedrock formation. The borings were extended into the apparent limestone until refusal of our flight augers equipped with carbide teeth occurred. Penetrations of 0 to 0.9 feet into the apparent limestone

Terracon

-2-

Terracon

formation were recorded. Core samples obtained with an NX size diamond bit core barrel may reveal other rock types and formations.

TESTING PROCEDURES

All samples recovered in the field were tested in the laboratory to measure their natural water contents and dry unit weights. Samples obtained by the split-barrel sampling procedure had only their natural water contents measured. Unconfined compressive strength tests were performed on selected native cohesive soil samples. A calibrated hand penetrometer was used to estimate the approximate unconfined compressive strength of other cohesive soil samples and existing fill soils. The calibrated hand penetrometer has been correlated with unconfined compression tests and provides a better estimate of soil consistency than visual examination alone. The results of the laboratory tests are given on the individual boring logs.

Atterberg Limits tests were performed on representative samples obtained from depths near the existing ground surface in the proposed building area, parking area, and future building site area. The Atterberg Limits tests provide accurate information on the plasticity of the soil and an indication of the potential for the soil to change volume with variation in water content. The tests also aid in the evaluation of the suitability of the native soils for use as compacted fill beneath floor slabs and pavements. The results of these tests are indicated on the boring logs and discussed later in this report.

Descriptive classifications of the soils indicated on the boring logs are in accordance with the enclosed General Notes and the Unified Soil Classification System. Also shown are estimated Unified Soil Classification Symbols. A brief description of this classification system is included in the appendix of this report. All classification was by visual-manual procedures and was performed by experienced personnel.

Classification of rock materials is in accordance with the enclosed General Notes and has been estimated from disturbed samples. Core samples and petrographic analysis may reveal other rock types.

-3-

Terracon

SITE CONDITIONS

The borings were drilled between September 29 and October 4, 1989, at the locations indicated on the enclosed location diagram. The borings were laid out by the drill crew. Distances from the referenced features to the boring locations indicated on the attached diagram are approximate and were measured by tape. Angles for locating the borings were estimated. Elevations of the borings are approximate and were obtained by the drill crew using a surveyor's level and rod. The elevations were referenced to the south nut of the top flange of the fire hydrant located approximately 60 feet north of the northwest corner of the proposed supermarket. An arbitrary elevation of 100.0 feet was assigned to this location. The rim of a manhole adjacent to the fire hydrant was measured to be at an elevation of 98.9 feet. The locations and elevations of the borings should be considered accurate only to the degree implied by the methods used to make these measurements.

The project site in general was covered with grass. The ground surface of the project site slopes downward toward the east from Fourth Street. Two houses with basements existed on the site at the time the subsurface exploration was completed. One of the homes is within the proposed supermarket building area; the other home exists in the northwest portion of the site where future development is planned. An existing street crosses the project site in a north-south direction. A salvage yard is adjacent to the eastern boundary of the project site. It is believed that a shallow creek or swale had traversed the project site and has subsequently been backfilled to develop the area surrounding the project site.

SUBSURFACE CONDITIONS

Borings B-1 through B-12, including Borings B-1A and B-1OA, were performed within the proposed supermarket building area. After reviewing the results of the borings as field work progressed, several borings were deepened, and Borings B-4 and B-9 were deleted from the subsurface exploration. Borings B-1A, B-3, B-1OA, B-11, and B-12 performed at the boundaries of the proposed building were extended to the underlying bedrock formation. Borings B-13, B-13A, and B-14 were performed near the north wall of the proposed

-4-

building to obtain samples for environmental evaluation. Borings B-15 through B-20 were performed in the proposed parking areas; however, Borings B-19 and B-20 were extended to greater depths in the area of the future building site.

Specific conditions at each boring location are indicated on the indiviual boring logs. The stratification boundaries shown on the boring logs represent the approximate location of changes in soil and rock types; in situ, the transition between materials may be gradual. Based on the results of the borings, subsurface conditions can be generalized as follows.

Supermarket Building Area

The borings performed within the limits of the proposed supermarket encountered approximately 2 to 5 inches of topsoil at the ground surface. Fill was encountered at boring locations B-1, B-6, and B-10 through B-12. The fill generally consisted of silty lean clay and lean clay soils with variable amounts of miscellaneous rubble such as gravel, brick, concrete, wood, metal, and cinders. The depth of the fill soils encountered varied from approximately 3.5 to 7 feet at boring locations B-1 and B-1A; 2 feet at Boring B-6; and between 7.5 to 16.5 feet along the north edge of the proposed building at boring locations B-10 through B-12.

To a depth of approximately 3 feet at Borings B-5 and B-7 and 7 feet at Boring B-2, dark brown, brown, and gray brown lean clay trace roots were encountered. The lean clay, in general, was very stiff and exhibits moderate potential for volume change with variation in moisture content as estimated from Atterberg Limits tests. Beneath the lean clay at these borings and below existing fill at Borings B-1, B-6, and B-10 through B-12, and from the ground surface at Borings B-3 and B-8, silty lean clay was encountered. The silty lean clay, in general, graded from brown to gray brown, to gray with depth. The silty lean clay exhibited very stiff to medium consistency in the upper 15 feet of the borings in which it was encountered; however, soft soils were encountered below 18 feet at Borings B-10 and B-11.

Terracon

Terracon

At Boring B-6, the silty lean clay extended to a depth of 18 feet where brown and gray, stiff to very stiff, fat clay was encountered. Boring B-6 terminated in the fat clay at a depth of 25 foot below existing ground surface. Borings B-1, B-2, B-5, B-7, B-8, and B-10 terminated at depths ranging from 15 to 20 feet below existing ground surface within the silty lean clay soils. The silty lean clay soils are believed to be derived primarily from loess. However, some of the softer soils encountered at depths below 20 feet may be alluvium.

Due to the soft soil conditions encountered at the site, borings near the proposed building corners, Borings B-1A, B-3, B-1OA, B-11, and B-12, were extended to underlying bedrock formations. Apparent limestone bedrock was encountered at depths ranging from approximately 37.1 to 42.5 feet below existing ground surface at Borings B-12 and B-1A, respectively. Using our flight augers equipped with carbide teeth, we were able to penetrate the limestone distances ranging from 0 to 0.9 feet at Borings B-3 and B-11, respectively, before auger refusal occured. Traces of limestone gravel within the overlying silty lean clay soils were encountered at depths varying from 36 to 41 feet below existing ground surface. The elevation of the apparent limestone bedrock formation, based upon our arbitrary site datum, varies from 55.8 to 58.7 feet.

Borings B-13, B-13A and B-14

Borings B-13, B-13A, and B-14 were performed within the project site north of the proposed supermarket building to obtain samples for analytical testing. Ten (10) to 15 feet of existing fill similar to that described in the previous subsection were encountered. Boring B-13 terminated at a depth of 15 feet within the existing fill. At a depth of 10 feet at Borings B-13A and B-14, olive gray silty lean clay was encountered. Borings B-13A and B-14 terminated at depths of approximately 20 feet within the silty lean clay.

Proposed Parking Area

Borings B-15, B-16, B-17, and B-18 were performed to a depth of 8 feet below existing ground surface in the proposed parking areas. Approximately

-6-

Terracon

2 inches of topsoil covered the area; however, 6 inches of gravel was encountered at Boring B-18. Fill was encountered to depths of 2 to 3 feet below existing ground surface at Borings B-15 and B-16. The fill consisted of lean clay with traces of sand, gravel, cinders, brick, wood, and concrete.

Below the existing fill at Borings B-15 and B-16 and extending to depths of 3 to 7 feet below the ground surface, dark brown lean clay was encountered. At the ground surface at Borings B-17 and B-18 and beneath the lean clay at Borings B-15 and B-16 fat clay soils were present. The native cohesive soils in the parking area were, in general, dark gray brown to gray brown and exhibted stiff to very stiff consistency. The near surface native soils in the proposed parking area exhibit, in our opinion, moderate to high potential for volume change as estimated from Atterberg Limits tests.

Future Building Site

Borings B-19 and B-20 were performed in the vicinity of the proposed future building site at the northwest corner of the supermarket project site. Approximately 2 feet of fill consisting of silty lean clay with traces of brick and cinders were encountered at the ground surface. The existing fill was underlain by stiff to very stiff, dark gray brown lean clay which extended to a depth of approximately 6 feet below existing ground surface. At this depth, medium to stiff silty lean clay was encountered. The silty lean clay, in general, was brown and gray brown. At a depth of 13 feet at Boring B-19, soft soils were encountered; at a depth of 13 feet in Boring B-20, stiff consistency fat clay was encountered. Borings B-19 and B-20 terminated at a depth of 15 feet below existing ground surface. The near surface lean clay soils exhibit a high potential for volume change with variation in moisture content as estimated by Atterberg Limits tests; the clay content of near surface soils was observed to increase with depth.

GROUNDWATER CONDITIONS

All borings were monitored while drilling and after their completion to detect the presence of groundwater. Groundwater was encountered at these times at all boring locations except for the relatively shallow

-7-

Terracon

Borings B-2, B-5, B-8, and B-15 through B-18. It is concluded that these shallow borings terminated above the level of the groundwater encountered in the other borings.

Groundwater was encountered while sampling at depths below existing ground surface ranging from 11.5 to 22 feet. After completion of drilling operations, groundwater was measured at depths of 11 feet to 25 feet below the ground surface. The groundwater level, in general, was encountered at shallower depths along the northern portion of the site and at greater depths near the southeastern portion of the project site. Long-term readings in cased holes or piezometers would be necessary to more accurately evaluate groundwater conditions.

Moist soil conditions and mottled soil coloring were observed at several boring locations above the measured water level. The mottled colors indicate to us that fluctuations in the groundwater table have probably occurred. Perched water may also occur within the existing fill areas following periods of heavy or prolonged precipitation. Fluctuations in the nearby Missouri River and Five Mile Creek water level may influence the depth at which groundwater is encountered. These possibilities should be considered when developing design and construction plans and specifications for the project. The presence of groundwater may hamper construction of drilled shaft foundations for the proposed structure.

ANALYSIS AND RECOMMENDATIONS

Variable soil conditions were encountered across the building site. A significant thickness of miscellaneous rubble fill was encountered in the area of the north portion of the proposed building. In addition, soft, potentially highly compressible soil conditions were encountered with depth in several of the borings.

Based upon this information developed during the subsurface exploration and our observations of nearby buildings on adjacent properties that have experienced foundation movements, we recommend the proposed supermarket building be supported on drilled pier foundations which extend to the underlying bedrock formations. In addition, recommendations are provided

-8-

Terracon

for removal of a portion of the existing fill beneath floor slabs and pavements. On site, near surface soils should be modified with lime or fly ash for use in the upper level of fill sections beneath floor slabs and pavements due to their high plasticities.

Site Clearing and Preparation

The existing fill located in the vicinity of the north portion of the proposed building (B-10, 10A, 11, 12, 13, 13A, and 14), in our opinion, is not suitable for support of floor slabs or pavements. We recommend that the existing fill which contains a significant amount of debris be removed to a minimum depth of 5 feet below the bottom of floor slabs and a minimum of 3 feet below the bottom of pavement sections. The excavated existing fill containing debris should be completely removed from the site to prevent incorporation of the miscellaneous fill material with new compacted fill. Traces of debris were noted in borings performed on the west side of the site as well (B-15, B-16, and B-20). These areas should be evaluated during site preparation also.

For developing rough grade on the site, we recommend imported low volume change fill or native high plasticity site soils modified with lime or fly ash be used within a minimum of 18 inches below floor slabs and 12 inches beneath pavement sections. Additional recommendations regarding the construction of low volume change subgrade zones are discussed in following sections.

In cut areas and areas where fill is to be placed, we recommend all surface vegetation and any topsoil or other loose, soft, or otherwise unsuitable material be removed. These materials should be stockpiled or removed from the site to prevent incorporation with new fill soils. After stipping, and removal of the existing fill and high plasticity site soils to the recommended levels, proofrolling with heavy construction equipment such as a loaded scraper or tandem-axle dump truck is recommended to aid in locating low strength areas. Unsuitable areas observed or encountered at this time should be undercut. Proofrolling aids in providing a firm base for compaction of the fill section and delineating soft or disturbed areas that may exist below subgrade level.

Terracon

After proofrolling is completed, we recommend that the exposed native soils in the building area be scarified to a minimum depth of 6 inches. The moisture content of the scarified soils should be adjusted to within 0 to 4 percent above the optimum moisture value and compacted to a minimum of 95 percent of the material's maximum standard Proctor dry density, ASTM designation D-698. In addition, exposed native soils in fill sections within the parking lot areas should be scarified and recompacted as recommended above.

We understand that the two houses which exist on the supermarket site will be razed as part of the new construction. The existing homes have limestone rock foundations. We recommend that the demolition debris be completely removed from the site to prevent incorporation of miscellaneous materials within new compacted fill sections. Foundation walls should be removed to a minimum of 2 feet below the bottom of pavement sections and floor slabs. Large limestone pieces removed from the foundation walls should be completely removed from the site. We recommend that the basement floors be sufficiently broken up to allow the migration of groundwater. The broken up floor slab should be tamped in place so no voids exist between the broken floor and underlying soils. New fill placed within the existing house basement areas should be placed and compacted as recommended in the following sections.

Drilled Pier Foundations

We recommend drilled pier foundations be used to support the proposed supermarket. Due to the nature of the existing fill over a portion of the building site and the presence of soft native soils at depth in some other borings, we believe that shallow foundation elements would not perform uniformly. Drilled pier foundations that extend to the underlying bedrock should not experience differential settlement which, in our opinion, would be experienced by shallow footing foundations. We recommend drilled piers be designed for end bearing on the underlying bedrock formations; an allowable end bearing pressure of 30,000 psf is recommended. Apparent limestone formations were encountered at depths ranging from 37.1 to 42.5 below existing ground surface. A minimum penetration of 6 inches into the

-10-

Terracon

apparent limestone formation is recommended to obtain suitable bearing on slightly weathered bedrock.

Excavation for drilled piers is not expected to be unusually difficult. Conventional earth auger excavating and drilling equipment should be able to penetrate the soil although a rock auger would probably be needed to achieve the recommended penetration into rock for bearing. Water was encountered at depths of 11 to 20 feet below existing ground surface in the borings. Temporary steel casing may be needed to advance drilled pier excavations and to possibly seal the water from entering the excavation. The bottom of the pier excavations should be cleaned of water and loose material before placing concrete. A minimum shaft diameter of 30 inches is recommended to allow hand cleaning and testing of the bearing surface. We recommend approximately 25 percent of the drilled shafts be tested by drilling a probehole extending a minimum of 3 feet or 1 shaft diameter beneath the bearing surface, whichever is greater. Terracon personnel should be retained to observe the bearing elevation and probeholes.

Relatively high groundwater levels and soft soils were encountered in the test borings. Therefore, we recommend that a minimum concrete head of 5 feet above the groundwater level be maintained during removal of temporary casing. There exists the possiblity that the soft soils may squeeze the excavated shaft; therefore, the volume of concrete placed in the excavated piers should be monitored during the removal of the casings.

Drilled piers excavated in areas of the existing miscellaneous fill may be susceptible to caving of the fill materials into the shaft excavation. Care should be taken so that concrete is not placed over caved material. A larger diameter section of casing may be necessary within the upper 15 to 20 feet of the piers to brace the existing fill materials during placement of concrete and the removal of other temporary casings.

We estimate that drilled shafts designed and constructed as recommended above should experience minor settlements, less than 1/4 inch.

-11-

Terracon

Floor Slabs

We estimate that the existing building site grades will be raised approximately 2 to 3 feet to provide drainage away from the building. As mentioned previously in the site clearing and preparation subsection, we recommend that in addition to stripping topsoil from the building area, the existing unsuitable fill material located in the north end of the building and possibly at other locations be removed to a minimum of 5 feet beneath floor slabs. The areal extent of existing miscellaneous fill material within the building area may not become apparent until construction. The exposed materials within the building area should be proofrolled as previously recommended prior to placing new fill.

We recommend an 18 inch thick zone of low volume change material be placed beneath floor slabs. The low volume change zone would include the thickness of any granular leveling course and may consist of imported low plasticity fill or native site soils modified with lime or fly ash to reduce their plasticity. On site native high plasticity cohesive soils may be used in fill sections beneath the low volume change zones of the floor slabs.

New fill soils should be placed in loose lifts not to exceed 9 inches in thickness and compacted to a minimum of 95 percent of the material's standard Proctor density, ASTM Specification D-698. Fill should be compacted at moisture contents 0 to 4 percent above the optimum moisture value determined by the standard Proctor test.

Imported soils used within the 18 inch low volume change zone beneath floor slabs should be low plasticity cohesive soil or granular soil having at least 18 percent low plasticity fines. Low plasticity cohesive soils exhibit a liquid limit less than 45 percent and a plasticity index less than 21 percent.

As an alternative to importing low plasticity material, native site soils removed from cut sections in the parking area may be used if treated with lime or Class "C" fly ash within low volume change zones beneath floor slabs. Modification of the existing moderately to highly plastic native

S . . .

Terracon

soils encountered near the ground surface in the proposed parking area should lower their plasticity to suitable levels. The estimated required quantities are 4 to 6 percent hydrated or quick lime, or approximately 15 percent Class "C" fly ash; quantities are based on dry weights. Modified native site soils should be placed and compacted as previously recommended.

Upon completion of the filling operation, care should be taken to maintain the minimum recommended moisture contents within the floor slab subgrade prior to construction of the floor slab. The procedures recommended above may not eliminate all future subgrade volume change beneath the floor slab. However, the procedures outlined should, in our opinion, reduce the potential for subgrade volume change to a small amount.

For the proposed lightly loaded slabs, and a subgrade prepared and tested as described above, we estimate the amount of floor slab settlement would be small, less than 1/2 inch.

Tunnels

Tunnels needed for refrigeration piping and other utilities are to be placed below the floor level. We estimate the tunnels will extend approximatley 4 to 5 feet below the floor slabs. We recommend that below grade walls subjected to lateral earth pressures be designed for lateral earth pressures equivalent to that exerted by a fluid with a density of 50 pounds per cubic foot. In addition, the surcharge from the overlying floor will contribute to the lateral loads on the walls. We recommend an additional uniform lateral load along the entire height of the wall equivalent to 45 percent of the floor slab load be applied for the design of tunnel walls.

The earth pressure conditions are presented on a diagram in the appendix of this report. Please note that this is for an "at-rest" stress distribution based on a condition of no wall rotation. No factor of safety or hydrostatic loading of the wall is included in this distribution.

Terracon

Drives and Parking Pavements

Borings performed in the parking area encountered between 0 to 3 feet of fill overlying silty lean clay or fat clay native soils. As previously recommended, the parking area should be stripped of topsoil, unsuitable miscellaneous debris fill materials, and high plasticity native soils to the recommended levels, and proofrolled. Unsuitable areas encountered or observed during proofrolling should be removed. In areas where deep unsuitable fill was encountered, such as the area north of the proposed building, a minimum of 3 feet of the existing fill materials should be removed beneath the bottoms of pavement sections prior to placing new compacted fill and pavement subgrades.

Imported low volume change soils or native site soils modified with lime or fly ash should be used within 12 inches of the pavement are recommended to create a stable pavement subgrade. The recommendations for lime or fly ash quantities and placement procedures presented in the Floor Slab subsection are valid for pavement subgrades.

Exposed native soils beneath the low volume change subgrade should be scarified to a minimum depth of 6 inches, adjusted to the recommended moisture levels and recompacted. All new fill should be placed and compacted as previously recommended. New fill sections should extend laterally a minimum of 12 inches beyond edges of pavements or curb and gutter.

Some preliminary pavement sections are outlined below. These sections are intended to be preliminary and should be reviewed when more details such as final grades, traffic loadings, and traffic volumes are known.

Based on soil types encountered at the project site and previous experience with soils of this type, a CBR value of 3 is estimated for design of parking and drive pavement sections. For this value, with light vehicle loads and low volumes, a full-depth asphaltic concrete section having a minimum total thickness of 5.5 inches is typical for parking areas, and 7 inches is typical for drive areas where loads are heavier and traffic is more channelized. A minimum surface course thickness of 2 inches is

-14-

Terracon

usually recommended. In addition, in areas for standing semi-trailer storage or dock areas, we recommend concrete pavements, a minimum of 7 inches thick should be used.

The above sections represent minimum design thicknesses, and as such, periodic maintenance should be anticipated. Pavements should be sloped to provide rapid surface drainage. Water allowed to pond on or adjacent to the pavement could saturate the subgrade and contribute to premature pavement deterioration.

Other Considerations

Future development in the northwest portion of the project site is being considered. All recommendations provided for site clearing and preparation, and floor slabs should be considered valid for the future development. However, we estimate that support of buildings with light wall and column loads on shallow footing foundations would be feasible in this portion of the site.

We recommend footing foundations be extended into the underlying native soils which were encountered approximately 2 feet below existing ground surface elevation in Boring B-19 and B-20. In this area, we preliminarily recommend that footings supported on the native lean clay soils be designed for a maximum net allowable total load soil bearing pressure of 2,500 psf. This is the pressure that may be transmitted to the bearing soils in excess of the minimum surrounding overburden pressure. We should review details of the proposed structure when the design is being finalized to determine if this foundation design bearing pressure is appropriate.

We recommend that perimeter footings or footings beneath unheated areas extend at least 3 feet below final outside grade for frost protection. We also recommend that isolated shallow footings have a minimum width of 2.5 feet, and continuous formed footings have a minimum width of 16 inches.

The base of foundation excavations should be free of water and loose soil prior to placing reinforcing steel and foundation concrete. Concrete should be placed soon after excavating so wetting or drying of bearing

-15-

Terracon

soils does not occur. Should the soils at bearing level become excessively dry or saturated, we recommend the affected soil be removed prior to placing concrete. Should a high groundwater table occur during construction, some water seepage into foundation excavations would be expected. The seepage rate of such water is expected to be minor, and, therefore, it should be possible to remove it by the use of sump pits and pumps.

Uncontrolled fill materials containing rubble and other miscellaneous matter were revealed in the test borings. Under no circumstances should footing foundations be supported over these existing fill soils without more extensive exploration and evaluation. Due to the uncontrolled nature of the fill, excessive differential settlements could occur upon trasmitting structural loads to these materials.

We estimate that settlements of footing foundations supported on native soils designed and constructed as recommended, would be small, less than 1 inch.

GENERAL COMMENTS

The analysis and recommendations presented in this report are based upon the data obtained from the soil borings performed at the indicated locations and from any other information discussed in this report. This report does not reflect any variations which may occur between borings or across the site. The nature and extent of such variations may not become evident until construction. If variations appear evident it will be necessary to reevaluate the recommendations of this report.

It is recommended that the geotechnical engineer be retained to review the plans and specifications so that comments can be made regarding the interpretation and implementation of our geotechnical recommendations in the design and specifications. It is further recommended that the geotechnical engineer be retained for testing and observation during earthwork and foundation construction phases to help determine that the design requirements are fulfilled.

-16-

Terracon

This report has been prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted geotechnical engineering practices. No other warranty, expressed or implied, is made. In the event that any changes in the nature, design or location of the project as outlined in this report are planned, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and the conclusions of this report modified or verified in writing by the geotechnical engineer.

Standard "N" Penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2 inch OD split spoon, except where noted.

WATER LEVEL MEASUREMENT SYMBOLS:

WL	:	Water Level	WS	:	While Sampling
WCI	:	Wet Cave In	WD	:	While Drilling
DCI	:	Dry Cave In	BCR	:	Before Casing Removal
AB	:	After Boring	ACR	:	After Casing Removal

Water levels indicated on the boring logs are the levels measured in the borings at the times indicated. In pervious soils, the indicated levels may reflect the location of groundwater. In low permeability soils, the accurate determination of ground water levels is not possible with only short term observations.

DESCRIPTIVE SOIL CLASSIFICATION:

Soll Classification is based on the Unified Soll Classification System and ASTM Designations D-2487 and D-2488. Coarse Grained Solls have more than 50% of their dry weight retained on a #200 sleve; they are described as: boulders, cobbles, gravel or sand. Fine Grained Solls have less than 50% of their dry weight retained on a #200 sleve; they are described as: clays, if they are plastic, and silts if they are slightly plastic or non-plastic. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size. In addition to gradation, coarse grained solls are defined on the basis of their relative in-place density and fine grained solls on the basis of their consistency. Example: Lean clay with sand, trace gravel, stiff (CL); silty sand, trace gravel, medium dense (SM).

CONSISTENCY OF FINE-GRAINED SOILS:

Unconfined Compressive Strength, Qu, psf

rengin, Qu, psi	Consistenc
< 500	Very Soft
500 - 1,000	Soft
1,001 - 2,000	Medlum
2,001 - 4,000	Stiff
4,001 - 8,000	Very Stiff
8,001 -16,000	Hard
> .16,000	Very Hard

Silt or Clay	Passing #200 sleve (0.075mm)

erraco

GENERAL NOTES

Sedimentary Rock Classification

DESCRIPTIVE ROCK CLASSIFICATION:

Sedimentary rocks are composed of cemented clay, silt and sand sized particles. The most common minerals are clay, quartz and calcite. Rock composed primarily of calcite is called limestone; rock of sand size grains is called sandstone, and rock of clay and silt size grains is called mudstone or claystone, siltstone, or shale. Modifiers such as shaly, sandy, dolomitic, calcareous, carbonaceous, etc. are used to describe various constituents. Examples: sandy shale; calcareous sandstone.

LIMESTONE Light to dark colored, crystalline to fine-grained texture, composed of CaCo₃, reacts readily with HCI.

DOLOMITE Light to dark colored, crystalline to fine-grained texture, composed of CaMg(CO₃)₂, harder than limestone, reacts with HCI when powdered.

CHERT Light to dark colored, very fine-grained texture, composed of micro-crystalline quartz (SI0₂), brittle, breaks into angular fragments, will scratch glass.

SHALE Very fine-grained texture, composed of consolidated silt or clay, bedded in thin layers. The unlaminated equivalent is frequently referred to as siltstone, claystone or mudstone.

SANDSTONE Usually light colored, coarse to fine texture, composed of cemented sand size grains of quartz, feldspar, etc. Cement usually is silica but may be such minerals as calcite, iron-oxide, or some other carbonate.

CONGLOMERATE Rounded rock fragments of variable mineralogy varying in size from near sand to boulder size but usually pebble to cobble size (1/2 inch to 6 inches). Cemented together with various cementing agents. Breccia is similar but composed of angular, fractured rock particles cemented together.

DEGREE OF WEATHERING:

SLIGHT Slight decomposition of parent material on joints. May be color change.

MODERATE Some decomposition and color change throughout.

HIGH Rock highly decomposed, may be extremely broken.

Classification of rock materials has been estimated from disturbed samples. Core samples and petrographic analysis may reveal other rock types.

Dear Mr. White:

Enclosed herein is Terracon Environmental's report on the shallow soils and groundwater assessment performed at the proposed Supermarket site located in Leavenworth, Kansas. This limited intrusive assessment was performed as a result of information obtained during a previous Phase I assessment of the site. The primary focus of this work was to assess subsurface conditions to help determine whether potential off-site contaminant sources may have adversely impacted the area of study.

We appreciate the opportunity to be of service to Four B Corporation on this project. If there are any questions concerning this report, or if we may be of further service to you, please do not hesitate to contact us at 816/891-7717.

Sincerely,

TERRACON ENVIRONMENTAL, INC.

ENVIRONMENTAL ASSESSMENT - PHASE II PROPOSED SUPERMARKET SITE LEAVENWORTH, KANSAS PROJECT NO. 50895161

1.0 INTRODUCTION

1.1 Background

This report presents the results of an intrusive environmental assessment of the tract of land located at the northeast corner of 4th and Marion Street in Leavenworth, Kansas. The assessment was completed in accordance with our proposal dated November 14, 1989.

1.2 Project Objective and Scope of Services

Information obtained during a Phase I environmental assessment of the subject property revealed that potential contaminant sources exist to the north, east and southeast of the site. As such, the intrusive assessment activities were designed to assess for potential shallow soil and groundwater contamination on the site as a result of possible migration from these off-site sources. The scope of work for this assessment included the following activities:

- installation of six groundwater monitor wells located along the perimeter of the property;
- field characterization of soil samples collected from each of the six monitor well boring locations;
- laboratory analysis of shallow soil samples collected from two monitor well boring locations;
 - laboratory analysis of groundwater collected from the monitor well locations;
 - collection of three discrete shallow soil samples along the east property line for total petroleum hydrocarbon and lead analysis; and,
 - ^o a final report detailing the work performed and summarizing the results.

Terracon

2.0 SITE DESCRIPTION

Two houses, a furniture store and two small sheds are located on the site. However, the subject property is primarily undeveloped with a majority of the site being tree and grass covered. An unimproved road, referred to as Third Street, runs through the center of the site allowing access to properties to the north. An abandoned railroad line is evident running along the east side of Third Street. Attached as Figure 1 is a site diagram.

The property slopes very gradually from the west to the east with approximately a six foot drop in elevation across the site. Surface drainage is generally to the east toward Five Mile Creek. Where the site is divided by 3rd Street, drainage is directed south toward Marion Street.

2.1 General Area

d m

Adjacent properties to the north of the site include Great Western Manufacturing, GNB Batteries, and the Leavenworth Service Center (former landfill). Property to the east and the southeast is occupied by an auto salvage yard, and automobile repair shops are located south of the property. To the west of the site, across Fourth Street, are light commercial and residential properties. A more detailed discussion of the surrounding area, including a review of historical site ownership, environmental regulatory correspondence and site photographs are contained in the initial Phase I assessment report issued on October 27, 1989.

Terracon

3.0 SOILS EXPLORATION

Based on the information obtained during the Phase I assessment of the property regarding potential off-site contaminant sources, Terracon Environmental conducted a limited scope soils exploration along the east property line and near the northeast corner of the site. This was performed in an effort to identify possible lead and/or petroleum contamination. As was reported in the Phase I assessment dated October 27, 1989, it is Terracon's understanding that underground fuel storage tanks on the Leavenworth Service Center property previously leaked an undetermined amount of gasoline. For this reason, and due to the long history of auto salvage activities east of the property, the soils exploration was conducted in this area.

3.1 Shallow Soils Sampling and Analysis

Three discrete shallow soil samples were collected on November 20, 1989, near what is considered the eastern property line. The samples were collected from a depth of approximately 2 feet below surface at three discrete locations along the east side of the fence bordering the auto salvage yard.

The samples were collected using a hand auger sampler which was cleaned with an Alconox detergent wash and rinse between borings to help prevent cross contamination. Laboratory analysis did not reveal total petroleum hydrocarbon levels in either of the three samples above a detection limit of 50 parts per million (ppm). Total lead was detected at concentrations of approximately 20 ppm in each of the three samples. Typical backgound levels for lead

Terracon

in this area are between 15 and 70 ppm¹; therefore, these concentrations can be considered in the typically observed range.

3.2 MW-3 and MW-4 Soils Sampling and Analysis

In an effort to identify shallow petroleum hydrocarbon contamination near the location of the underground fuel storage tanks on the Leavenworth Service Center property, soil samples were collected from the MW-3 and MW-4 boring locations. A discrete soil sample was collected from each boring at the 3 foot below surface depth and submitted to the laboratory for total petroleum hydrocarbon (TPH) analysis.

The results indicate TPH at a concentation of 140 ppm in the 3 foot depth sample from MW-3, and 260 ppm in the 3 foot depth sample from MW-4. These elevated levels in the shallow soils may be the result of previous gasoline spillage associated with fuel loading practices, and in part may be attributed to degradation of organic matter contained in the fill material in this boring. It is important to note that no volatile organic constituents of gasoline (i.e. benzene, toluene, and ethylbenzene) were detected in a previous composite soil sample collected from this area during the Phase I assessment. Also, the results of the groundwater sample collected from MW-3 and MW-4 did not detect the presence of benzene, toluene or xylene. Although the concentrations of TPH detected in the 3 foot soil samples from MW-3 and MW-4 are above what would be considered typical background concentrations, an evaluation of all the data does not suggest that this is indicative of a serious or widespread environmental concern.

Jon J. Connor and Hansford T. Shacklette, <u>Background</u> <u>Geochemistry of Some Rocks, Soils, Plants and Vegetables in</u> the Conterminuous United States, (Washington, 1975) p. F84.

Terracon

4.0 GROUNDWATER EXPLORATION

To assess groundwater quality at the site, Terracon conducted an intrusive exploration along the perimeter of the property. The intrusive assessment consisted of the drilling and installation of six monitor wells along the perimeter of the site to better determine whether potential off-site contaminant sources may have impacted the subject property. Three wells were installed along the north property line, two wells were installed along the east property line and one well was installed near the southwest corner of the property. See Figure 1 for monitor well locations.

4.1 Drilling Activities

Terracon Environmental installed six groundwater monitor wells at the site on November 20 and 21, 1989. Field operations for the drilling phase of the monitor well installation was performed by a three-man drill crew using hollow stem augers and a rotary drill rig. Prior to the exploration, the working end of the rig was detergent washed using a high pressure, hot water sprayer. During drilling, lead augers and downhole sampling equipment were cleaned between borings to reduce the potential for cross contamination.

The strata was field logged based upon visual classification. The soils encountered in the boreholes consisted primarily of clay and silty clay, with fill material noted in borings MW-3, MW-4 and MW-5. The fill material was presumably used to backfill the former Five Mile Creek channel which, prior to 1968, looped to the west of its present course and across the northeast portion of the

Terracon

property. At the time of drilling, water was observed in all six borings. In MW-1 and MW-5, water was detected at approximately 18 feet below surface. In MW-2, MW-3, MW-4 and MW-6 water was detected at approximately 13 feet below surface. Boring logs are attached as Appendix I.

4.2 Field Characterization

During drilling, soil samples were collected from each boring at approximately the 3 foot and 10 foot depth, where possible, for field screening. Samples were placed in one-quart glass jars approximately one-half full, covered with aluminum foil, and allowed to volatilize at ambient conditions for a minimum of fifteen minutes. A photoionization detector (PID) was then used to analyze air contained in the headspace of the jar for chemical contamination. The PID is an instrument used to provide field characterization for the limited quantitative identification of a broad range of organic vapors based upon a relative instrument standard.

Readings from the PID for samples across the site did not exceed 0.7 ppm, except for the 3 foot sample collected from MW-3 which registered a level of just less than 200 ppm. No sample was recovered at the 10 foot depth while drilling MW-3 due to fill material which plugged the continuous sampling equipment. The elevated headspace reading in this boring is consistent with an organic odor noted during drilling. No other elevated readings were detected with the PID during field characterization of the soils.

It is also important to note that field characterization did not reveal elevated volatiles contamination (benzene, toluene, xylene) in any of the samples collected from this general area during the previous Phase I assessment work.

Terracon

4.3 Well Installation and Development

The well materials consist of two-inch nominal diameter, Schedule 40 PVC, flush-jointed, threaded pipe. Factory slotted 0.01 inch well screen was installed at the bottom of each borehole and extended to intersect the water table based upon water levels encountered during drilling. A 15 foot section of slotted screen was used for MW-2 and MW-5, and a 20 foot section of slotted screen was used for MW-1, MW-3, MW-4 and MW-6. Solid stem PVC riser pipe was attached to each of the screened sections and extended approximately 2.5 feet above ground surface.

The borehole annulus was packed with a fine sand from the bottom of the borehole to a point approximately one foot above the slotted well screen. An approximate one to two foot thick layer of hydrated bentonite pellets was installed in the borehole annulus above the sand pack. The remaining annulus was filled to ground surface with a cement/bentonite grout mixture. Upon completion, the well heads were secured within protective metal casings which rise approximately 3 feet above ground surface, and locked with keyed-alike padlocks. Figure 2 shows a typical monitor well design. Specific well diagrams for MW-1 through MW-6 are included on the boring logs in Appendix II.

Well development was performed by Terracon Environmental personnel using individual disposable bailers. The wells were considered developed when approximately three standing water volumes were removed from each casing. Development fluids were not collected.

Terracon

4.4 Sampling Procedures and Analysis

Groundwater samples were collected from the monitor wells on November 24, 1989. The samples were obtained using individual disposable bailers and placed in preserved sample containers. The samples were cooled, packaged, and shipped via Federal Express to Continental Analytical Services in Salina, Kansas. Samples obtained from monitor wells 1 through 5 were analyzed for benzene, toluene and xylene (BTX). Additionally, samples collected from monitor wells MW-1, MW-2, MW-3 and MW-5 were analyzed for total lead.

The BTX and lead analyses were designed to identify potential migration of petroleum products and/or lead from sources to the north and east (i.e. GNB Batteries, City Maintenance Garage, Auto Salvage Yard). Samples collected from monitor wells MW-3, MW-4, MW-5 and MW-6 were subjected to a survey search for extractable compounds (semi-volatile compounds) and volatile organic compounds. This analysis is designed to identify organic compounds present as a result of former landfill activities adjacent to the site and fill material on the property. Finally, samples collected from monitor wells MW-4 and MW-6 were analyzed for the 13 priority pollutant metals. Elevated metals concentrations could be expected due to landfill and salvage yard activities, as well as other nearby industrial sites.

4.5 Analytical Results

Analytical results for MW-1, MW-2, MW-3 and MW-5 revealed no detectable concentrations of benzene, toluene, xylene or total lead. Also, results for MW-3, MW-5 and MW-6 identified no volatile or semi-volatile compounds above a detection limit of approximately 5 parts per billion (ppb).

The concentrations of metals detected in MW-6 were either at the detection limit or below detection limits. However, the analytical results for MW-4 revealed elevated levels of some metals, compared to the results for MW-6, and a concentration of 18 ppb for an unidentified semi-volatile compound found to be present during the survey search analyses. In some instances, the concentrations of metals are above those established as maximums for drinking water standards. The table below lists the metals concentrations in mg/l or part per million (ppm) for MW-4 and MW-6, and includes their respective National Drinking Water Standard.

	<u>MW-4</u>	<u>MW-6</u>	*National Drinking Water Standards
Arsenic	0.06	<0.01	0.05
Cadmium	0.97	<0.01	0,010
Chromium	0.17	<0.04	0.05
Copper	0.52	<0.05	1.0
Lead	3.0	<0.003	0.05
Nickel	0.28	<0.05	
Zinc	7.45	0.01	5.0

* Reference: 40 CFR 141 and 143

The metals results from MW-4 suggest that there has been some impact to the groundwater in this vicinity. The probable source or sources are the former landfill to the north of the site and the auto salvage yard to the east. An EPA study conducted in 1984 of the former landfill site involved analytical testing of water from nearby Five Mile Creek. (The creek runs to the east of the former landfill and the salvage yard.) Results of the EPA study found that elèvated metals concentrations were present in Five Mile Creek, and that this may be due in part to the former

Terracon

Terracon

landfill, the auto salvage yard and/or other industrial properties in the area. EPA concluded in their study of 1984, that the former landfill site 'poses no threat to the surrounding environment.'

The metals concentrations detected during our assessment were found to be less than those reported by EPA during their nearby study. Although the metals concentrations from MW-4 are elevated with respect to what may be considered typical of groundwater in the area (as indicated by the analytical results from MW-6), the groundwater at this location is not utilized as a drinking water source.

5.0 SUMMARY AND CONCLUSIONS

No indication of petroleum-based contamination was detected in the shallow groundwater as a result of sampling for benzene, toluene and xylene. Additionally, the results of screening for a broad range of volatile and extractable compounds via a mass spectral survey search found nothing which would indicate a serious or widespread environmental contamination problem exists in the shallow groundwater at this site.

Analysis of shallow soils from MW-3 and MW-4 indicate that a localized area of relatively low-level petroleum hydrocarbon contamination may exist near the northeast portion of the property. However, the concentrations detected do not suggest that a serious or widespread environmental concern exists.

Based upon a review of the analytical data which has been collected by both EPA and Terracon, it appears that off-site contaminant sources may have impacted the shallow groundwater

near the northeast portion of the subject property. Elevated levels of certain metals detected in MW-4 are above National Drinking Water Standards; however, at this time the groundwater at this location is not utilized as a drinking water source. An EPA study performed in 1984, found elevated levels of aluminum, barium, copper, iron, lead magnesium, manganese, mercury, nickel and vanadium in the Five Mile Creek samples downstream of the former landfill and auto salvage yard properties. The EPA study concluded that based on the analytical results from samples collected from Five Mile Creek, no threat to the surrounding environment is expected. Terracon recommends that the monitor wells be retained at this site to provide sampling points should future groundwater monitoring be desired.

6.0 GENERAL COMMENTS

The analysis and comments presented in this final report are based upon data obtained from the shallow soil and groundwater assessment activities performed as part of the work scope, and other information collected by Terracon as described herein. Please note that this report does not reflect any variations of subsurface stratigraphy or environmental contamination which may exist between borings or across the site. Actual subsurface conditions may vary, and the extent of such variations may not become evident without further investigation. If variations appear evident, it will be necessary to reevaluate the comments contained in this report.

This report is prepared in accordance with generally accepted engineering practices within the constraints of the client's directives. The report is intended for the

Terracon

Terracon

exclusive use of the client for specific application to the assessed property. No other warranty is expressed or implied.

GOVERNOR JEFF COLYER, M.D. JEFF ANDERSEN, SECRETARY

August 13th, 2018

Steve King Solid Waste Foreman 100 North 5th Street Leavenworth, Kansas 66048

RE: City of Leavenworth Dump Site Visits.

On August 9th, I visited several of the old city dump sites located in Leavenworth, Kansas. I met Mark Matzeder at the old city dump which is now utilized as permitted brush burn site before continuing on to the other various sites. That site appeared to be in acceptable condition with no recommendations for modifying the practices currently exercised in maintaining the site.

Several other sites listed below were also visited throughout the day and presented in acceptable condition as well. KDHE does appreciate the efforts put forth by the City and respective landowners in maintaining the closed sites. The next scheduled visits for the sites will be during the calendar year of 2023.

Please do not hesitate to contact me at (785) 296-1757 or by email at <u>kevin.heit@ks.gov</u> if there are any questions regarding this letter or the program.

Regards

Kevin Heit Environmental Specialist Compliance, Assistance & Enforcement Unit 1000 SW Jackson Street Suite 320 Topeka, Kansas 66612

Project: Leavenworth Animal Control Project No.: 12017

Field Report No.: 003 Date: 7/8/13

Date:	7/3/13	Weather:	Sunny
Time:	8:00am		

Temp. Range: High 60's

Est. % of Completion: 5%

Conformance with Schedule (+,-):

1. The project is generally on schedule.

Present at Site:

- 1. Dennis McMillian Wilcott Construction
- 2. Dalyn Novak WSKF Architects
- 3. Excavating Crew (1 worker)

Work in Progress:

- 4. Dennis and Dalyn measured the existing foundation that was found at the west side of the site, directly in front of the new building. The foundation is, on average, 3'-0" wide x 3'-0" deep.
 - a. The dimensions were agreed upon and signed by Wilcott Construction, WSKF Architects, and Frederick Excavating. See attached document for measurements and signatures of approval.
 - Dennis directed the excavator to dig around the foundation at the northwest section to verify that the foundation continued to the west along the north edge. It was confirmed that the foundation continued and this area is included in the attached document.

Observations:

- 5. It appears as though the existing foundation continues under the chain link fence on the west side of the site and possibly under the Price Chopper parking lot.
- 6. A possible cleanout for the sanitary sewer line was found when the excavator was digging around the existing foundation.
- The city had the tanks and the small shed removed from the site.
 - a. Dennis said that he thought they removed them late afternoon/evening of July 2nd.
 - b. Two of the tanks were relocated to the northwest of the site, still on the city's property.
 - c. Contents from the tanks were spilled on the site during the relocation.
- 8. Some of the pier rebar was stored on-site.
- The building pad appeared to be to grade with the building corners staked.
- 10. The staff parking lot has been staked although grading still needs to occur along the north side of the site. There is still a lot of concrete, rebar, miscellaneous debris on the north side of the site.
- 11. An existing storm water inlet and piping was found and removed during grading.
- 12. Most of the dirt from the hotel site has been used. The remaining dirt has debris in it, organic and inorganic material.

13. Asphalt reinforcing fabric was used on the asphalt over the existing foundation.

Items to Verify:

14. None at this time.

Information or Action Required:

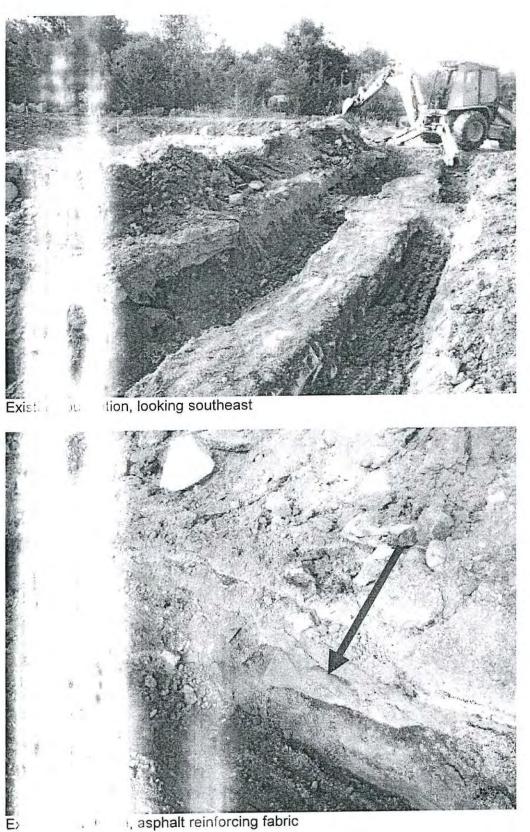

15. Pricing for the removal of the existing foundation is requested from Complete Excavating.

Photos

16. NOTE: 45 photos of the construction progress were taken during the site visit and are on file at WSKF's office.

Architecture Interior Design Illustration Planning

Project: Leavenworth Animal Control Project No.: 12017 Field Report No.: 008 Date: 8/14/13

Date:8/14/13Weather:SunnyTime:8:00am

Est. % of Completion: unknown

Conformance with Schedule (+,-):

1. The project is generally on schedule.

Present at Site:

- 1. Dennis McMillian Wilcott Construction
- 2. Dalyn Novak WSKF Architects
- 3. Sean Goecke City of Leavenworth
- 4. Rebar Crew (4 workers)
- 5. Plumbing Crew (3 workers)
- 6. Excavating Crew (1 worker)
- 7. Leavenworth Water Department (3 workers)

Work in Progress:

- 8. The remaining rebar was dropped off this morning and placed north of the Price Chopper parking lot. Steel lintels are the only steel that Dennis says he is currently missing.
- The excavator was digging the trench for the trash enclosure footing with the rebar crew's help.
 a. Much debris (rebar, wooden post, concrete chunks) was brought to the surface with the dirt.
- 10. The plumbing crew was installing the under slab plumbing in the southeast dog claim kennel (Dog Claim 123).
- 11. The Leavenworth Water Department was digging under the building foundation to bring the waterline into the building.
 - a. The Water Department agreed to backfill their trench under the foundation with rock.

Observations:

- 12. The Leavenworth Water Department has completed the majority of the waterline.
 - a. The pipe along the west side of the site has already been covered except for the last section before the turn to the building.
 - b. The fire hydrant was in place although the valve box was not complete.
 - c. There was some damage to the concrete drive adjacent to the waterline trench. This damage appears to have been done during the trenching by the Water Department.
- 13. Dennis stated that the gas line will be installed above the waterline in the same trench.
- 14. Under slab plumbing has been installed in the Multi-purpose Room, Restrooms, Large Dog Adoption and was being installed in Dog Claim 123.
 - a. Plumbing supplies are being stored in the northeast corner of the Price Chopper parking lot.

Temp. Range: Low 70's

- 15. Dennis removed a section of the Price Chopper parking lot chain link fence to get from the parking lot into his storage area to the north of the parking lot.
- 16. Dennis stated that the trees on the east side of the building have been cleared out to the construction limits.
 - a. Sean Goecke was going to talk with Chief Kitchens about where they want the excess site dirt to be located on-site.
 - i. At the last progress meeting Mike McDonald of the Public Works Department said that they do not have the equipment needed to remove trees although he said they would look at the site to see what they could do, if anything.
 - ii. Sean is to update WSKF on the city's intent.
 - b. The removal of the spillage from the tanks has not been cleaned up as of yet. Dennis, Dalyn, and Sean discussed this and Sean said that he would work towards getting Public Works out to clean up the site.
 - i. Dennis also mentioned that there was some spillage in some standing water north of the Price Chopper parking lot as well although none was visible today.

Items to Verify:

17. None at this time.

Information or Action Required:

18. WSKF to provide Dennis with some additional dimensioning for the dog kennel curbs.

Photos

19. NOTE: 43 photos of the construction progress were taken during the site visit and are on file at WSKF's office.

DEPARTMENT OF HEALTH AND ENVIRONMENT

June 29, 1987

Robert Patzwald City of Leavenworth - Garage 5th & Shawnee Leavenworth, Kansas 66048

Dear Mr. Patzwald:

This is to acknowledge that you filed a Notification of Hazardous Waste Activity Form on June 3, 1987 for the facility located at the address shown below to comply with both state and federal regulations. The EPA Identification Number, type of hazardous waste activity and a description of hazardous waste are listed below. This number must be included on all shipping manifests for transporting hazardous waste; on all annual reports that generators of hazardous waste and owners of hazardous waste treatment, storage and disposal facilities must file with the state; on all applications for hazardous waste permits; and other correspondence related to your hazardous waste management activities.

EPA Identification Number: KSD065766701

Installation Address: 3rd & Marion Leavenworth, Kansas 66048

Type of Hazardous Waste Activity: Generator

Description of Hazardous Waste: D001, D002

Since the State of Kansas received authorization from EPA to conduct the state's generator and transporter hazardous waste program in lieu of the respective federal program, we are to be notified of any additions to and/or modifications of the information provided on your notification. All questions or assistance pertaining to the handling of hazardous waste should also be directed to this office.

Sincerely yours,

John W. Mitchell^C Hazardous Waste Section Bureau of Waste Management

Robert Patzwald City of Leavenworth - Garage 5th and Shawnee Leavenworth, Kansas 66048

Dear Mr. Patzwald:

In my June 3, 1987 letter to you, the City of Leavenworth - Garage at 5th and Shawnee was assigned EPA identification number KSD065766701.

The EPA Regional Office has determined this identification number is incorrect and should not be used. They have assigned EPA identification number KSD980632210 to the 5th and Shawnee location.

I am sorry if this has caused you any inconvenience.

Sincerely yours,

W. Mitchell

BURLAU OF SEP 3 0 1991 AIR and WASTE MANAGEL ENT

Mr. Robert Lowry Assistant Public Works Director City Hall 5th & Shawnee Leavenworth, Kansas 56048

Re: Hazardous Waste Compliance Inspection City Service Center 2101 South 3rd. Leavenworth, Kansas 66048 EPA Identification Number KSD980632210

Dear Mr. Lowry:

On September 24, 1991, your facility was inspected to determine compliance with state hazardous waste regulations.

The inspection revealed your facility generates the following hazardous wastes as defined by 40 CFR, Part 261, Subparts C & D as adopted by 4.A.R. 28-31-2:

	Wastes Generated	Waste	Codes
1.	Safety-Kleen Solvent		DG01
2.	Paint Contaminated Thinner		F005

The quantity generated is more than 25 kilograms (approximately 55 pounds) but less than 1000 kilograms (approximately 2200 pounds) per month. Your facility is considered a Kansas generator and is regulated under K.A.R. 23-31-4 excluding K.A.R. 23-31-4 excluding K.A.R. 23-31-4 (g) and K.A.R. 28-31-4(m).

As a Kansas generator, you must comply with the requirements listed on rages 8 and 9 of the enclosed Bulletin 4.12, *Hazardous Waste Generator's Handbook*. Basically, these regulations require you to obtain an EPA Identification Number, manifest wastes shipped off-site, package, label, mark, and placard all containers, maintain records, and meet storage requirements. In addition, you must conduct personnel training and meet emergency response requirements. Robert Lowry/Leavenworth September 26, 1991 Page 2

The inspection identified the following items not in compliance with state and federal regulations concerning generators of hazardous waste:

- The inspection revealed that paint contaminated thinner is disposed by dumping it on the ground. This method of disposal is illegal and must be discontinued immediately. (K.S.A. 64-3441, Unlawful Acts) Waste thinner must be accumulated in a properly marked container for disposal as hazardous waste.
- 2. When there is a change in the information originally submitted to obtain an EPA identification number, the generator must update that information. These changes shall be submitted to the department on a form supplied by the department. K.A.R. 28-31-4 (C)(1).

Please submit the enclosed subsequent notification form showing the change of address of the City Service Center.

The above violations must be corrected by October 31, 1991. Notify the department in writing when corrected and identify the corrective action taken for each violation noted.

The inspection revealed an area of visibly contaminated soil located on the north side of the sign shop. According to information provided, waste paint and paint contaminated thinner are disposed in this area. As a result of the contamination, the soil in the subject area has the potential of being classified as hazardous waste. Therefore, soil samples must be collected for Toxicity Characteristic Leaching Procedure (TCLP) testing. The testing must be conducted by a laboratory certified by the state of Kansas. You were instructed to collect a composite sample at 6" and 18-24" [two (2) samples] and to provide the department with a drawing of the contaminated area showing the sample collection Please provide the department with test results and other requested points. information by October 31, 1991. Also, there is evidence of waste paint and paint thinner being dumped into a storm drain located near the sign shop. The storm drain discharges to 5 Mile Creek which courses through the east side of the City Service Center. The practice of disposing of paint wastes in this manner must be discontinued immediately. As previously indicated, paint wastes must be accumulated for proper disposal. A copy of this report will be provided to the Bureau of Water for appropriate follow up.

The inspection also revealed the city service center is moving to the old Missouri Valley Fabricator's site and that the existing site will be cleaned up. Part of the clean-up should involve the removal of oil stained areas, with the contaminated soil taken to the landfill. Paint contaminated soil may require disposal as hazardous waste in accordance with state and federal regulations. In order that disposal records be maintained, please provide the department with documentation reflecting the quantity of oil contaminated soil disposed at the landfill.

•

SECTION IV TATALAND FIRE AND EXPLOSION DATA CARAGEMENTER AND EXPLOSION DATA

PAGE PROD 0110 B/L 117311 22

FLAMMABILITY LIMITS (% IN AIR): 1.4 FLASH POINT (AND METHOD). 5 C/45 F (TCC)

FLAMMABILITY CLASSIFICATION: CLASS I B

RECOMMENDED EXTINGUISHING MEDIA: NFPA CLASS B EXTINGUISHER (CO2, DRY CHEMICALS OR FOAM) FOR CLASS I B FIRES.

SPECIAL FIRE FIGHTING PROCEDURES .

WATER SPRAY MAY BE INEFFECTIVE ON FIRE BUT CAN PROTECT FIRE FIGHTERS AND COOL CLOSED CONTAINERS. USE FOG NOZZLES IF WATER IS USED. USE AIR SUPPLIED BREATHING MASKS.

UNUSUAL FIRE/EXPLOSION HAZARDS: KEEP AWAY FROM HEAT, SPARKS AND OPEN FLAME.

THRESHOLD LIMIT VALUE: TWA=100 PPM (375 MG/M3) STEL=150 PPM (560 MG/M3)--SKIN OSHA PEL: TWA=100 PPM (375 MG/M3) STEL=150 PPM (560 MG/M3)

EFFECTS OF OVEREXPOSURE: CONTACT WITH EYES CAN CAUSE MODERATE TO SEVERE IRRITATION. CONTACT WITH SKIN CAN CAUSE DRYING, IRRITATION AND DERMATITIS. INHALATION CAN CAUSE CENTRAL NERVOUS SYSTEM DEPRESSION INCLUDING FATIGUE, WEAKNESS, HEADACHE, DIZZINESS, NAUSEA AND VOMITING, UNCONSCIOUSNESS, COMA, RESPIRATORY FAILURE AND DEATH. PREEXISTING EYE, SKIN AND RESPIRATORY DISORDERS MAY BE AGGRAVATED BY EXPOSURE TO THIS PRODUCT.

EMERGENCY FIRST AID PROCEDURES:

EYE CONTACT: FLUSH WITH WATER TO 15 MINUTES AND GET MEDICAL ATTENTION. SKIN CONTACT: REMOVE CONTAMINATED CLOTHING AND SHOES. WASH EXPOSED AREAS WITH SOAP AND WATER. IF IRRITATION PERSISTS, GET MEDICAL ATTENTION.

INHALATION: REMOVE TO FRESH AIR. IF BREATHING HAS STOPPED, GIVE ARTIFICIAL RESPIRATION. GET MEDICAL ATTENTION.

INGESTION: CALL PHYSICIAN IMMEDIATELY! DO NOT INDUCE VOMITING!

STABILITY: STABLE

CONDITIONS TO AVOID: HEAT, SPARKS, OR OPEN FLAMES

INCOMPATIBILITY WITH OTHER MATERIALS: ISOLATE FROM STRONG OXIDIZERS SUCH AS PERMANGANATE.

HAZARDOUS DECOMPOSITION PRODUCTS: CARBON MONOXIDE FROM THERMAL DECOMPOSITION.

PAGE PROD 0110 B/L 117311 3

HAZARDOUS POLYMERIZATION: WILL NOT OCCUR

IN CASE OF FIRE: USE WATER FOG, CO2, DRY CHEMICAL OR FOAM.

PROCEDURES IF MATERIAL IS SPILLED OR RELEASED. CONTAIN SPILL. VENTILATE AREA. ISOLATE FROM SOURCES OF IGNITION. ABSORB ON INERT MEDIA AND CONTAINERIZE. ALWAYS WEAR PROTECTIVE CLOTHING AND RESPIRATORY PROTECTION WHEN CLEANING UP SPILLS.

WASTE DISPOSAL PROCEDURES: INCINERATE PER LOCAL, STATE AND FEDERAL POLLUTION REGULATIONS.

RESPIRATORY PROTECTION: A NIOSH-APPROVED RESPIRATOR FOR ORGANIC VAPORS

LOCAL EXHAUST: RECOMMENDED

PROTECTIVE GLOVES: SOLVENT RESISTANT SUCH AS RUBBER OR NEOPRENE.

EYE PROTECTION: SAFETY GOGGLES

OTHER PROTECTIVE EQUIPMENT: EYE-WASH, SAFETY SHOWER, PROTECTIVE CLOTHING.

SECTION IX -----ADDITIONAL PRECAUTIONS

KEEP AWAY FROM HEAT, SPARKS AND OPEN FLAME. USE ONLY WITH ADEQUATE VENTILATION. AVOID PROLONGED OR REPEATED BREATHING OF VAPOR OR SPRAY MIST. AVOID CONTACT WITH EYES, SKIN AND CLOTHING. KEEP CONTAINER CLOSED WHEN NOT IN USE.

OTHER PRECAUTIONS:

DO NOT STORE ABOVE 49 C (120 F). STORE LARGE AMOUNTS IN STRUCTURES MADE FOR FLAMMABLE LIQUIDS. EMPTY CONTAINER HAZARDOUS. CONTINUE ALL LABEL PRECAUTIONS. DO NOT FLAME CUT, BRAZE OR WELD.

February 18, 1992

Mr. Robert Lowery City Hall 5th & Shawnee Leavenworth, Kansas 66048

Re: Hazardous Waste Compliance Inspection of September 24, 1991 City Service Center 2101 South 3rd Street Leavenworth, Kansas 66048 EPA Identification Number KSD980632210

Dear Mr. Lowery:

In my letter dated September 26, 1991, you were requested to provide information documenting action taken to correct violations noted during the inspection. This information was to be provided by October 31, 1991. To date, the department has not received this information.

Please provide the department with the requested information in writing by March 2, 1992.

After reviewing the analyses for the soil sample collected near the sign shop, it was determined that although contamination exists, the contamination level does not meet the definition of hazardous waste. Therefore, the areas of visible contamination must be removed and disposed in your permitted sanitary landfill. In order to properly dispose of this material, you must first obtain a disposal authorization. To obtain a disposal authorization, please provide the following information:

- 1. Type and Quantity of Material to be disposed.
- 2. Analyses information.

Please submit this information to Mr. Robert Kinder, Kansas Department of Health and Environment, Bureau of Air and Waste Management, Forbes Field, Building 740, Topeka, Kansas, 66620-0001, phone 913/296-1596. Please submit this information as soon as possible. Robert Lowery/Leavenworth City Service Center February 18, 1992 Page 2

If you have questions concerning this letter, please call me at 913/842-4600.

Respectfully,

Jim Fischer Environmental Technician Inspections and Enforcement Section Bureau of Air and Waste Management

Re: Report of Testing - City Service Center 2101 South 3rd Street, Leavenworth, Kansas Kansas City Testing Laboratory #8211-91-0050

Dear Jim:

Attached (finally) is a copy of the test results you requested. It does not appear as if we have a major problem - at least not at the 18"-24" depth.

Please let me know what corrective actions need to be taken, especially since we plan to vacate that facility within the next sixty days.

Happy New Year!

Sincerely,

Bob Lowry Deputy Public Works Director

BL/jgb

Mr. Robert D. Patzwald Public Works Department CITY OF LEAVENWORTH 100 N. 5th Street Leavenworth, KS 66048

Re: Report of Testing - City Service Centerk. D. H. E. 2101 South 3rd Street Leavenworth, Kansas KCTL #8211-91-0050

Dear Mr. Patzwald:

This letter and its attachments constitute our report of test results as requested by the Kansas Department of Health (KDHE) letter dated September 26, 1991 and a telephone conversation with Mr. Jim Fisher (KDHE).

SCOPE OF SERVICE

The following scope of service has been provided:

- Dispatched an environmental professional to the site.
- Collected soil samples at 6" and 18-24" from six locations, north of the sign shop.
- Composite the 6" samples and the 18-24" samples (two samples).
- Analyzed the two soil samples for toxicity characteristics leaching procedure (TCLP) 8 RCRA metals, TCLP Organic Compounds and Volatile Organic Compounds (VOCs).
- 5. Provide a report of project results.

PROJECT OBSERVATION

A backhoe supplied by the City of Leavenworth was used to excavate the six sampling locations (Figure 1 - Sampling Locations). Soil samples were collected from each excavation at 6" and 18-24". The 6" samples were composite and the 18 to 24" samples were composite (two samples). Chemical analysis was performed by Pace Incorporated located at 9608 Loiret Boulevard, Lenexa, Kansas.

TCLP ANALYTICAL TEST RESULTS

TCLP Metals (8 RCRA) were not detected at or above the laboratory instrument's method detection limit in both the 6" and 18 to 24" samples.

TCLP Organic Compounds were not detected at or above the laboratory instrument's method detection limit in both the 6" and 18 to 24" samples.

Volatile Organic Compounds (VOCs) were detected in the 6" sample. Concentrations of the following compounds were found in the 6" sample:

1,1,2,2-Tetrachloroethane - 19,000 parts per billion (ppb) Chlorobenzene - 12 ppb Xylenes - 28 ppb

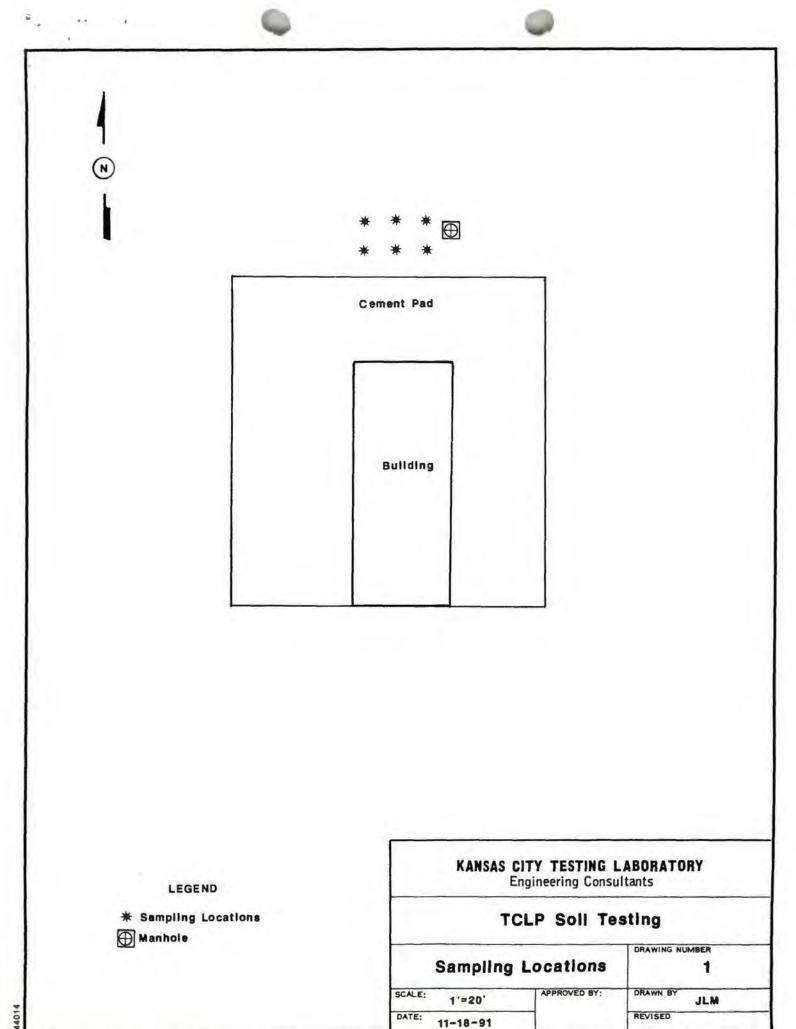

VOCs in the 18 to 24" sample were not detected (ND) at or above the laboratory instrument's method detection limit (MDL).

A copy of the laboratory report and chain-of-custody prepared by Pace Incorporated are attached.

Prepared and Submitted by: KANSAS CITY TESTING LABORATORY

Re: Hazardous Waste Compliance - City of Leavenworth City Service Center EPA ID #KSD980632210 KCTL #8210-91-0059

Dear Mr. Fisher:

To comply with the Kansas Department of Health & Environment (KDHE) letter dated September 26, 1991, the City of Leavenworth has hired Kansas City Testing Laboratory (KCTL) to test soils at the City Service Center located at 2101 South 3rd Street, Leavenworth, Kansas.

The soil samples will be taken from the area of visibly contaminated soil located on the north side of the sign shop. Six locations will be chosen and sampled at 6" and 18-24". The 6" samples will be composited and the 18-24" samples will be composited. The two samples will be chemically analyzed following the toxicity characteristic leaching procedure (TCLP) pursuant to All 40 TCLP parameters will be analyzed. The 40 CFR 261.24. samples will be analyzed by Pace Labs, a Kansas certified laboratory located at 9608 Loiret Blvd., Lenexa, Kansas 66219 (913-599-5665).

KCTL expects mobilization to the site within one week or less. Laboratory results will be available three weeks following the collection of the sample and a final report within one week of receiving the laboratory analysis.

Respectfully Submitted, KANSAS CITY TESTING LABORATORY

Dear Mr. Lowery:

Thank you for your letter dated April 2, 1992. Based on the information provided and my observations during my April 13, 1992, follow-up inspection, the violations found during the September 24, 1991, inspection have been corrected.

Your cooperation with the hazardous waste management program is appreciated. If you have questions concerning this letter, please call me at the Northeast District Office at 913/842-4600.

Respectfully,

Jim Fischer Environmental Technician Inspections and Enforcement Section Bureau of Air and Waste Management

Re: Hazardous Waste Compliance Inspection of September 24, 1991 City Service Center, 2101 South 3rd Street, Leavenworth, Kansas EPA Identification Number KSD980632210

Dear Mr. Fischer:

The items which you identified during your last inspection as being not in compliance have been corrected as follows:

- 1. a. In accordance with instructions received from Bob Kinder of the KDHE Office in Topeka, the ground contamination which resulted from dumping paint thinner on the ground was remedied by removing the contaminated soil and disposing of it at the Leavenworth Landfill. Approximately 60 cubic yards of contaminated soil was removed and spread at the landfill. The hole was then backfilled with clean dirt taken from the borrow pit located across from the Water Pollution Control facility on South 2nd Avenue.
 - b. All operations at the old paint shop were terminated October 1991, and training of personnel regarding use and disposal of toxic wastes has taken place. We have recently instituted weekly training sessions, and at least one session each month is devoted to environmental concerns. To facilitate future operations, we are converting to water base paint for all of our pavement markings.
- On March 3, 1992, an application was submitted to KDHE for an EPA Identification Number at the new Municipal Service Center site, 790 Thornton Street. A copy of that application and the KDHE response is attached as requested.

The City of Leavenworth is committed to complying with all State and Federal Environmental Laws, and to being good stewards of our environmental resources. We especially appreciate the support your organization has provided to us, and the positive manner in which you have provided assistance to us.

Sincerely,

Deputy Public Works Director

RE: Hazardous Waste Compliance Assistance Visit, Great Western Mfg. Co., Inc., EPAID: KSD007136872, Leavenworth County, Kansas

Dear Mr. Wood,

On March 7, 2012, I conducted a compliance assistance visit (CAV) at the above referenced facility to determine compliance with Kansas Administrative Regulations (KAR) and Kansas Statutes Annotated (KSA). This visit was conducted under the authority of the CAV agreement entered into on October 18, 2011. As a result of the visit, 16 deficiencies were observed.

On May 25, 2012, I received a response to the deficiencies from Mike Downie, Summit Safety Group, on behalf of the facility. The response is adequate to correct violations the remaining deficiencies. With regards to deficiency 3, please be aware that if the facility is using the same paint gun cleaning solvents that were being used at the time of inspection, the resulting hazardous waste will be a listed waste as well as ignitable.

Also, in the letter mailed to you on May 2, 2012, I inadvertently labeled the facility's deficiencies as violations. To be clear, there were no violations cited as a result of my visit.

Your cooperation with the waste management program is appreciated. If you have questions concerning this letter, please call me.

Respectfully,

RE: Hazardous Waste Compliance Assistance Visit for Great Western Manufacturing in Leavenworth, KS

Dear Mr. D'Alfonso:

I have received your May 2, 2012 letter to Steve Wood of Great Western Manufacturing. In it you request further information related to your compliance assistance visit. Below I have provided the information you requested.

Violation 1A - The facility has stopped cleaning paint booth guns by spraying them into the filters. With our knowledge of the process, we have determined that the paint booth filters are hazardous waste and are being disposed as such.

Violation 3 - Please see attached hazardous waste determinations for paint booth filters and paint gun cleaning waste. We do not have any waste lamps. We only have used lamps that are being handled as an Universal Waste.

Violation 8 - Attached are three weeks of inspection logs.

Violation 10 - Attached is a copy of the emergency information. The scan/fax did not come across clearly, but the black area on the right has daytime and 24 hr contact information for plant personnel; and local emergency officials.

Violation 13 - Doug Price of Great Western Manufacturing is reviewing rider manifests and inspecting them for errors.

Violation 15 - A copy of the signed manifest #001225800 is attached.

If you have any further questions, please contact me directly at 417-343-3200 or via email at mdownie@summitsafetygroup.com.

Sincerely,

Melo Vounie

٦.

DATE: May 8, 2012

SUBJECT: Hazardous Waste Compliance Assistance Visit, Great Western Mfg. Co., Inc., EPAID: KSD007136872, Leavenworth County, Kansas

In my May 2, 2012 follow-up letter to the facility, replying to their response, I inadvertently listed the facility's deficiencies as "violations". The visit at the facility was a compliance assistance visit, not a compliance inspection, thus no violations were cited.

RE: Hazardous Waste Compliance Assistance Visit, Great Western Mfg. Co., Inc., EPAID: KSD007136872, Leavenworth County, Kansas

Dear Mr. Wood,

On March 7, 2012, I conducted a compliance assistance visit (CAV) at the above referenced facility to determine compliance with Kansas Administrative Regulations (KAR) and Kansas Statutes Annotated (KSA). This visit was conducted under the authority of the CAV agreement entered into on October 18, 2011. As a result of the visit, 16 deficiencies were observed.

On April 16, 2012, I received a response to the deficiencies from Mike Downie, Summit Safety Group, on behalf of the facility. The response is adequate to correct violations 1B, 2, 4-7, 9, 12, 14 and 16. The response is inadequate to correct violations 1A, 3, 8, 10, 13, & 15 as follows:

Violation 1A – To correct this violation, the facility must stop cleaning paint guns by spraying them out in the paint booth. After further review of my notes, it was determined that this method of cleaning paint guns is considered treatment of hazardous waste. Waste solvent from cleaning paint guns must be determined and disposed of properly. The solvents that were being used at the time of my visit would make the waste hazardous, requiring disposal with a hazardous waste vendor. As discussed during my visit, the facility's paint booths may not be a hazardous waste once this practice stops and the filters are changed out.

Violation 3 – Please submit a sample of the facility's hazardous waste determinations. Please include the written waste determinations for paint booth filters, paint gun cleaning waste and waste lamps.

Violation 8 - Please submit the at least the first three weeks of the facility's weekly inspection logs.

Violation 10 -- Please submit a copy of the emergency information that the facility has posted.

Violation 13 – Please be aware that the facility typically does not control how many "rider" manifests are used during the shipment of hazardous waste. Most often, the number of "rider" manifests is determined by how many different transporters are used to transport the waste to the designated facility. The facility needs to ensure that all copies of manifests that are received from the designated facility are thoroughly inspected for errors. Any errors that are found should be discussed and corrected with the vendor.

Violation 15 – Please submit a copy of manifest #001225800 GBF that is signed by the designated facility.

Also, per the compliance assistance visit agreement, please find enclosed a copy of the facility's Hazardous Waste Compliance Assistance Visit Report that has been submitted to the Bureau of Waste Management.

This notice is provided to call immediate attention to those areas of non-compliance. This notice does not constitute a compliance order issued by KDHE and may not be a complete listing of all violations which may be identified as a result of this inspection. You must submit in writing by May 25, 2012, all requested materials

Your cooperation with the waste management program is appreciated. If you have questions concerning this letter, please call me.

Respectfully, alla -205

Brian D'Alfonso KDHE Waste Management Program Northeast District Office 800 West 24 Street Lawrence, KS 66046

RE: Hazardous Waste Compliance Assistance Visit for Great Western Manufacturing in Leavenworth, KS

Dear Mr. D'Alfonso:

I have been authorized by Steve Wood of Great Western Manufacturing to respond to your Notice of Deficiency letter dated March 14, 2012.

Below are our responses to each item.

1) Unlawful disposal of hazardous waste

A. Paint booth filters are now disposed as hazardous waste. The attached picture shows the box that the waste hauler, Crystal Clean, has supplied to ship the filters.

B. Paper wipes are no longer used in the Sta Put spraying area. Cloth wipes are now being used. they are laundered and reused.

2) Waste from the two blast cabinets has been analyzed and found to be non-hazardous. Attached are the lab results used to make this determination.

3) Written waste determinations have been made for all waste streams

4) Containers of Universal Waste - Used Lamps have been labeled. See attached pictures.

5) The boxes of used lamps have been closed. See attached pictures

6) Universal Waste training has been added to the list of topics that are covered in the annual employee safety training

7) A new threaded funnel with latch has been purchased and installed. See attached picture.

8) Doug Price is now doing weekly hazardous waste storage inspections. He utilizes a preprinted checklist to document the inspections.

9) The weekly inspections noted in item 8 includes the date and time of inspection, name of inspector, notations and observations, and date and nature of remedial actions.

Lenexa Office: 913-327-5421 • Springfield Office: 417-823-7233 • www.summitsafetygroup.com

10) Emergency information including the 24 hour phone number of the two emergency coordinators, location of fire extinguishers and spill control equipment, and 911.

J.

11) A hazardous waste training program has been developed for the hazardous waste coordinator and assistant at Great Western. Training was completed this month by Mike Downie of Summit Safety. All employees will be trained at the annual training meeting.

12) Great Western has contacted Crystal Clean and asked them to ensure their drivers double check the ID numbers. They also asked about pre-printed manifests to help reduce the chance of errors from hand printing.

13) Multiple manifests will no longer be used.

14) Crystal Clean has been notified to only use the codes that correctly classify the hazardous waste.

15) Great Western will maintain manifests for at least 3 years from date of shipment.

16) Crystal Clean has been notified to generate a corrected Land Disposal Restriction to be sent to the TSDF after the next shipment.

If you have any further questions, please contact me directly at 417-343-3200 or via email at mdownie@summitsafetygroup.com.

Sincerely,

Mile Howie

Mike Downie, CSP President

Item #4 picture of labeled and closed Universal Waste containers

Item #4 picture of labeled and closed Universal Waste containers.

Item #7 threaded and latched funnel on hazardous waste drum.

Has the company declared any information/processes as trade secrets KSA 65-3447?
Yes No If yes, explain: NA

Has this facility been previously inspected by EPA and/or KDHE? Xes IN No If yes, please summarize the following:

Date	Agency	Description of Violation (do not need to include reg. citations or comments)
9-28-87	KDHE	Container Marking, Container Inspection, Placarding, Personnel Training, Notification

<u>Changes since the previous inspection:</u> (Please provide a brief description of any significant process, waste, management, ownership, or other pertinent changes since the previous inspection. If no previous inspection, this section should be blank.)

The facility's contact person has changed since the last inspection.

Facility Description: (# of buildings, approximate size of each building, basic activity in each building, processes, etc.), if not already described in previous reports or in changes since previous inspection section of this report:

The facility consists of three buildings. The main building is approximately 40,000 square feet and all manufacturing occurs in the main building. All of the facility's office space is also in the main building. The other two buildings are approximately 5000 square feet each and are used solely for storage.

Additional Information: (Include pertinent information from this inspection that does not pertain to violations or comments and is not already discussed in other sections)

This inspection was conducted as a hazardous waste compliance assistance visit (CAV) (see attachment 11). When I arrived at the facility to conduct a routing compliance inspection, Mr. Price informed me that he had submitted the CAV request to Jim Rudeen, Bureau of Waste Management (BWM), one to two weeks prior to my arrival. I contacted Mr. Rudeen to inquire about the facility's CAV application. Mr. Rudeen confirmed that the facility had applied for a CAV. Mr. Rudeen and I decided to conduct the inspection as a CAV. The facility agreed and signed the CAV agreement prior to the inspection.

Exit Conference:

Date of Exit Conference: 3-8-12

Were all violations, comments, corrective actions, and response due dates discussed with the facility if applicable? Xes No

Was the possibility of additional violations and possible enforcement discussed with the facility?

Were the generator status and applicable regulatory requirements discussed with the facility during the exit briefing and/or previously during the inspection? X Yes I No

List of items provided to facility:		
NOC/NONC	Yes	🖾 No

Violations and Comments

Were Violations cited:	🛛 Yes	🗌 No
Were written comments made:	🗋 Yes	🛛 No

Provide a detailed description of each violation and comment, including photo references, attachment references, and regulatory citations below:

Area of Concern / Deficiency

Deficiency 1 - Unlawful disposal of hazardous waste, in violation of KSA 65-3441(a)(1).

- Paint booth filters During my inspection, Mr. Watkins and Mr. Hutchens stated that they clean paint guns in the paint booths by spraying solvents through the guns in the paint booth allowing the filters to catch the waste solvent. Mr. Watkins stated he uses Sherwin Williams Lacquer Thinner (see attachment 3) and straight methyl ethyl ketone (MEK) for cleaning his paint guns. The lacquer thinner is ignitable and contains regulated amounts of toluene, acctone and MEK, making the waste a D001, F003 and F005 hazardous waste. Mr. Hutchens stated he uses straight xylene for cleaning his paint guns, making the waste a F003 hazardous waste. I explained to both painters and Mr. Price that these solvents are listed hazardous wastes when used for cleaning, making the paint booth filters hazardous. I asked Mr. Watkins and Mr. Hutchens how the paint booth filters are disposed of when changed and they the paint booth filters are disposed of in the regular trash. I explained that the paint booth filters must be managed as hazardous waste if the facility keeps cleaning their paint guns in this manner. We then discussed other practices that would keep the paint booth filters from becoming hazardous, such as collecting the cleaning solvents. The facility had tested their paint booth filters for metals and determined they were non-hazardous for heavy metals (see attachment 4).
- Solvent contaminated paper wipes Paper wipes are being used to clean glue in the wood assembly area with Sta'-Put ST172 thinner (see attachment 5). This solvent contains greater than 10% methylene chloride and trichloroethylene, making the wipes a F002 hazardous waste. I explained to Mr. Price that the wipes must be collected and disposed of as hazardous waste if the facility maintains the same process.

Deficiency 2 - Failure to determine, as required by 40 CFR 262.11.

The facility is disposing of waste from two blast cabinets in the regular trash. According to Mr. Price, the waste from these blast cabinets has not been analyzed for heavy metals to make an accurate waste determination. One cabinet is used with glass beads for cleaning stainless steel and the other cabinet is used for cleaning all other metals with Garnett beads. I explained to Mr. Price that the wastes must be tested for heavy metals to make a proper waste determination.

Deficiency 3 - Failure to maintain written waste determinations, as required by 40 CFR 262.40(c). HW Cover Page Revised: 5-2-11

Page 3 of 5

At the time of inspection, the facility did not have written waste determinations for all waste streams. Mr. Price produced analytical for waste paint booth filters (see attachment 4), but no other documentation of determinations was presented.

Deficiency 4 - Failure to label two containers of universal waste with the proper label, as required by 40 CFR 273.14(e).

At the time of inspection, there were two containers; one box and one light tube that contained waste fluorescent lamps and were not labeled (see photos 1 & 2). There was a third container that was properly labeled. I explained the requirements to Mr. Price and he stated he understood.

Deficiency 5 – Failure to close one container of universal waste, except when adding or removing waste, as required by 40 CFR 273.13(d)(1).

One box of universal waste lamps was not closed at the time of inspection (see photo 1). I explained to Mr. Price that all containers of universal waste must be closed at all times except when adding or removing waste.

Deficiency 6 - Failure to train employees on proper management of universal waste, as required by 40 CFR 273.16.

Mr. Price stated that no training has been conducted addressing the proper management of universal waste. Also, facility personnel stated they did not know that the containers must be closed and did not know what type of label was required on the containers. I explained to Mr. Price that universal waste management must be included with the facility's waste training. Mr. Price stated he understood.

Deficiency 7 - Failure to keep all containers of hazardous waste closed at all times except when adding or removing waste, as required by 40 CFR 265.173(a).

One 55-gallon container of hazardous paint waste had a funnel that did not attach to the drum or latch closed with a seal (see photo 3). I explained the requirements of a closed container to Mr. Price, including funnel types, and explained where he could find the department's technical guidance document on closed hazardous waste containers. Mr. Price stated he understood.

Deficiency 8 - Failure to conduct weekly inspection of hazardous waste storage areas, as required by 40 CFR 265.174.

The facility is conducting monthly inspections of hazardous waste storage containers as part of their storm water plan (see attachment 6). I explained to Mr. Price that as a small quantity generator (SQG) of hazardous waste, the facility must conduct these inspections weekly. Mr. Price stated he understood. I left a weekly hazardous waste storage area log template with Mr. Price that he could use.

Deficiency 9 – Failure to include time of inspection on the hazardous waste storage container inspection log, as required by 40 CFR 265.15(d).

The facility's inspection log discussed in deficiency 8 was missing the time of inspection (see attachment 6). I explained the items that must be documented during the inspections and explained that the items were all on the template left on site.

Deficiency 10 - Failure to post emergency information, as required by 40 CFR 262.34(d)(5)(ii).

The required emergency information was not posted in the facility. I explained to Mr. price that the facility must post, next to at least one telephone which is accessible with little or no delay, the name and telephone number of emergency coordinator(s), location of fire extinguishers, spill control material, and if available, fire alarms, and the telephone number of the fire department unless the facility has a direct alarm (911 is acceptable). I also explained that if the facility relies solely on cell phones, the information still must be posted, and all posted phone numbers must be programmed into the cell phones. Mr. Price stated he understood.

Deficiency 11 - Failure to establish a hazardous waste training program, as required by KAR 28-31-262a(d)(1).

Facility personnel stated that a hazardous waste training program has not been established. I explained the requirements of the facility's training program. Mr. Price stated he understood.

Deficiency 12 - Wrong EPAID number on manifest, in violation of 40 CFR 262.20(a).

Manifest number 001464373 GBF contained the EPAID # KSD000136872 (see attachment 7). The facility's EPAID # is KSD007136872. I explained to Mr. Price that the facility must contact their hazardous waste vendor to correct the manifests in the future.

Deficiency 13 - Failure to include correct page number on multiple manifests, as required by 40 CFR 262.20(a).

During my record review I observed multiple manifests that included a rider manifest (second page) used solely for extra transporters. The first page of these manifests was not corrected to indicate that a second page was used (see

HW Cover Page Revised: 5-2-11

attachment 8). I explained to Mr. Price that the facility must contact their hazardous waste vendor to correct the manifests in the future.

Deficiency 14 - Failure to include waste codes on manifests, as required by 40 CFR 262.20(a).

My inspection showed that the facility's waste paint related material carries waste codes D001, F003, F005, and D035 at a minimum. The facility's manifests show the waste to carry waste codes F003, F005, D007 and D008 (see attachments 7, 8, & 9). During my record review, facility personnel provided me with analytical results that showed the waste does not contain regulated levels of heavy metals (see attachment 4), thus waste codes D007 and D008 do not need to be included on the waste manifest. I explained to Mr. Price that the facility must contact their hazardous waste vendor to correct the manifests in the future.

Deficiency 15 – Failure to retain a copy of the manifest signed and dated by the designated facility, as required by CFR 262.40(a)

The facility only had the initial copy of manifest # 001225800 GBF (see attachment 9). I explained to Mr. Price that the signed manifest must be maintained for three years. I also explained what the facility should do if the signed copy is never received. Mr. Price stated he understood.

Deficiency 16 – Failure to include manifest number and waste codes on the land disposal restriction notification form (LDR), as required by 40 CFR 268.7(a)(2).

The facility had multiple LDRs for the waste paint related material waste stream (see attachment 10). None of the LDRs included the proper waste codes as discussed in deficiency 14 or a manifest number. I explained to Mr. Price that the facility should contact their waste vendor and ensure that a proper LDR is sent with the next manifest to the TSDF. I also explained that a corrected LDR must be maintained on site, and could be used to replace the old LDRs. Mr. Price stated he understood.

ā,

HAZARDOUS WASTE GENERATOR COMPLIANCE INSPECTION REPORT

GI	ENERAL REQUIREMENTS (GGR)				
1.	Has the generator evaluated each potentially hazardous waste to determine	YES	NO	NAV	′ #
1.	if it is hazardous? 40 CFR 262.11		\boxtimes		2
	 a. If waste was tested, was the analysis conducted by a laboratory certified by KDHE? KAR 28-31-262(c)(2) b. If waste was not tested, did the generator use knowledge of the hazardous 				
	 characteristics of the waste in light of the materials or processes used? 40 CFR 262.11(c)(2) c. Is documentation of the waste determination kept for three years from the date 	\boxtimes			
	the waste was last sent to on-site or off-site treatment, storage or disposal? 40 CFR 262.40(c)		\boxtimes		3
2.	If hazardous waste is disposed of via the sanitary sewer to a Publicly Owned Treatment Works (POTW), has the generator received written approval from the City - POTW?			\boxtimes	
3.	Has the facility obtained a Special Waste Disposal Authorization (SWDA) for each special waste? KAR 28-29-109(c)			\boxtimes	
4.	If the generator treats or recycles hazardous waste on-site (such as in a still), do they count waste correctly? 40 CFR 261.5(d)(2) a. If the waste is not counted, is it exempt because of a closed-loop system?			XX	
5.	Has the KSQG, SQG, or LQG notified KDHE and obtained an EPA Identification Number? 40 CFR 262.12(a) (Mark NA only for CESQG)				
6.	Is current notification accurate? (Updates must be made within 60 days of the change) KAR 28-31-4	\boxtimes			
	NIVERSAL WASTE				
7.	Does the facility choose to manage some of its waste as universal waste? If no, skip this section. If yes, check each type of universal waste that applies: batteries mercury-containing equipment pesticides lamps				
8.	Is the facility a small quantity handler of universal waste (accumulates <11,000 lbs or <5,000 kgs)? If the facility is a large quantity handler of universal waste, explain under "additional information" and skip the remaining questions in this section. These questions are designed only for small quantity handlers of universal waste.				
9.	If the facility manages mercury-containing equipment, do they remove mercury-containing ampules from equipment? If yes, are the requirements of 40 CFR 273.13(c)(2) met? (These include using secondary			\boxtimes	
	containment during the removal, having a mercury spill kit available, training employees, and other requirements.) 40 CFR 273.13(c)(2)			\boxtimes	

A

	If yes, describe	-			
	acceptable manner? 40 CFR 261.5(g)			\boxtimes	
16.	Is the CESQG recycling, treating, or disposing of hazardous waste on-site in an	YES	NO	NAV	#
G					
	Note: Small quantity handlers are not required to keep records of shipments of universal waste	Э.			
	 Has a shipment been sent to a foreign destination? (if yes, explain in additional information section.) 		\boxtimes		
	a. Has a shipment sent by this handler ever been rejected? (if yes, explain in additional information section.)				
15.		\boxtimes			
	If yes, was it cleaned up and a proper waste determination made on the cleaned up material? 40 CFR 273.17(b)				
14.	Has there been a release of universal waste at this facility?	П			
13.	Have employees been trained on proper management of universal waste? 40 CFR 273.16				6
,12.	Can the accumulation time (date became a waste or from receipt date) be demonstrated by date on container, date in accumulation area, date on individual waste items, inventory system, or other method? 40 CFR 273.15(c)	\boxtimes			
	 Mercury-containing equipment (the word "thermostat" can be substituted for the words "containing equipment") 40 CFR 273.14(d) Lamps 40 CFR 273.14(e) 		\square		4
	 "Universal Waste", or "Waste" or "Used"? a. Batteries (only damaged or leaking batteries must be contained) 40 CFR 273.14(a) b. Pesticides 40 CFR 273.14(c) Note: cannot use the words "Used Pesticides" 1. Is the original pesticide label or other approved label, also present? 			XXX	
11.	Is each container (or unit if not containerized) marked appropriately with one of the following phrases (substitute the appropriate universal waste for the blank)?:				
	 a. Batteries (only damaged or leaking batteries must be contained) 40 CFR 273.13(a)(1) b. Pesticides 40 CFR 273.13(b)(1) c. Mercury-containing equipment 40 CFR 273.13(c)(1) d. Lamps 40 CFR 273.13(d)(1) 				5
10.	Are all universal wastes managed in closed containers that are structurally sound, adequate to prevent breakage, compatible with the contents of the container, lack evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions?	_	_	573	

٩

17. If the CESQG is accumulating less than 55 lbs (25 kgs) of hazardous waste on-site, is the CESQG sending this waste off-site for treatment, storage, or disposal according to?
 40 CFR 261.5(g)

If yes,	describe	<u></u>			
(If des	cribed on the	e waste stream tab	ile, don't repeat h	ere.)	

(If Non-Accumulating CESQG, stop here)

.

18.	······································		NO NA V#
	CESQG sending waste off-site for treatment, storage, or disposal, to a TSD or some other approved waste management facility (HHW)? KAR 28-31-262a(f)(2)(B)		
19.	Does generator package, label (fiammable liquid, poison, etc.), and mark (consignee's or consignor's name and address, etc.) waste in accordance with the requirements outlined in 49 CFR Parts 172, 173, 178, and 179 (DOT)? 40 CFR 262.30 (package), 40 CFR 262.31 (label), 40 CFR 262.32(a) and (b) (mark)		
20.	Does the generator only use a transporter who has registered with KDHE and obtained an EPA Identification Number? KAR 28-31-262a(a)(2)		

٨

CONTAINER MANAGEMENT REQUIREMENTS

NOTE: SAA refers to Satellite Accumulation Area. SAAs do not apply to CESQGs, whose containers must all meet storage requirements.

.

21.	For the SAA, is 55-gallons or less of each waste stream accumulated at or near the point of generation, in one container, which is under the control of the operator of the process generating that waste? KAR 28-31-262(c)(6)	\boxtimes		
22.	Is each container managed as a storage container within three days of no longer meeting the definition of a satellite container? 40 CFR 262.34(c)(2) [Note: If this satellite container violation is cited, do not cite storage container violations (weekly inspections and accumulation start date) for the same containers.]			
23.	Is the accumulation start date marked on each storage container? 40 CFR 262.34(a)(2)		\boxtimes	
24.	Is each container clearly marked with the words "Hazardous Waste"? 40 CFR 262.34(a)(3) [storage] or KAR 28-31-262(c)(7) [SAA]	\boxtimes		
25.	Are all containers holding hazardous waste in good condition? 40 CFR 265.171	\boxtimes		
26.	Are all containers holding hazardous waste compatible with the contents? 40 CFR 265.172	\bowtie		
27.	Are all containers holding hazardous waste closed except when necessary to add or remove waste? 40 CFR 265.173(a)			7
28.	Does the <u>CESQG</u> or <u>KSQG</u> conduct inspections at least every 31 days looking for signs of deterioration and leaks in containers in <u>storage</u> ? KAR 28-31-262a(f)(2)(A) [CESQG] or KAR 28-31-262a(e)(2) [KSQG] Or		\boxtimes	
	Does the <u>SQG</u> or <u>LQG</u> conduct weekly inspections of areas where containers are stored for signs of leakage and/or deterioration caused by corrosion or other factors? 40 CFR 265.174			8
29.	If the answer to question 28 was yes, are these inspections documented in a log that Includes complete date and time of inspection, name of inspector, notations of observations, and date and nature of remedial actions? 40 CFR 265.15(d)			9

			YES NO N/			
30 .	 Incompatible wastes: a. If incompatible wastes or incompatible wastes and materials were placed in the same container, were the requirements of 40 CFR 265.17(b) complied with? 40 CFR 265.177(a) b. If hazardous waste was placed in an unwashed container that previously held incompatible waste or material, were the requirements of 40 CFR 265.17(b) complied with? 40 CFR 265.177(b) c. If storage containers of hazardous waste are incompatible with any waste or other materials stored nearby, are the containers separated from the other materials by means of a dike, berm, wall or other means? 40 CFR 265.177(c) 			\boxtimes		
				\boxtimes		
				\boxtimes		
31.	Are <u>storage</u> containers holding ignitable or reactive waste(s) located at least 50 feet (15 meters) from the generator's property line? (<u>LQG Only</u>) 40 CFR 265.176			\boxtimes		
32.	Are storage containers currently meeting all AA, BB, and CC requirements (LQG Only) 40 CFR 265.178			\boxtimes		
33.	If the CESQG or KSQG is accumulating (including SAAs) 2,200 lbs (1,000 kgs) or more of hazardous waste, check yes and continue with SQG generator requirements.			\boxtimes		
34.	If the CESQG or KSQG or SQG is accumulating (including SAAs) 2.2 lbs (1 kgs) or more of acutely hazardous waste, check yes and continue with LQG generator requirements.					
	(if Accumulating CESQG, <2,200 ibs, stop here)					
35.	Is the SQG storing 13,200 lbs (6,000 kgs) or less of hazardous waste for 180 days or less (270 days if transporting waste more than 200 highway miles)? 40 CFR 262.34(d)			\boxtimes		
36.	Is the LQG storing hazardous waste for 90 days or less? 40 CFR 262.34(a)			\boxtimes		
REPORTING AND RECORDKEEPING						
37.	Has the generator (KSQG, SQG, and LQG) submitted an annual monitoring fee and report to KDHE indicating their current generator status on a form provided by the department? (LQGs are required to pay the annual fee every year, but this report is only required to be submitted in the odd years when the biennial report is not submitted.)	\boxtimes				
	KAR 28-31-262a(b) (if neither report nor fee were submitted) KAR 28-31-10(a) (if only fee is missing)					
38.	If yes to number 37, was a copy of the report kept for a minimum of 3 years after the date of the signature on the report? KAR 28-31-262a(b)(4)	\boxtimes				
39.	Has the LQG submitted biennial report(s) to KDHE by March 1 of even years? 40 CFR 262.41(a) a. Does the LQG retain a copy of the biennial report for three years? 40 CFR 262.40(b)			\boxtimes		
·40.	If the generator has exported/imported hazardous waste to/from a foreign source, did they comply with the requirements of 40 CFR 262.53(a), 40 CFR 262.54, and/or 40 CFR 262.60(a)?			\boxtimes		

.

-.

.

If hazardous waste was exported or imported to/from a foreign source, please describe under "additional information".

EN	/IERG	ENCY PREPAREDNESS AND TRAINING REQUIREMENTS FOR KSQGs AND SQGs

Notice of Defficiency March 14, 2012

Steve Wood Great Western Manufacturing Co., Inc. 2017 South 4th Street Leavenworth, KS 66048-3928

RE: Hazardous Waste Compliance Assistance Visit, Great Western Mfg. Co., Inc., EPAID: KSD007136872, Leavenworth County, Kansas

Dear Mr. Wood,

On March 7, 2012, I conducted a compliance assistance visit (CAV) at the above referenced facility to determine compliance with Kansas Administrative Regulations (KAR) and Kansas Statutes Annotated (KSA). This visit was conducted under the authority of the CAV agreement entered into on October 18, 2011. As a result of the visit, 16 deficiencies were observed as follows:

Defficiency 1 - Unlawful disposal of hazardous waste, in violation of KSA 65-3441(a)(1).

- Paint booth filters During my inspection, facility personnel stated that they clean paint guns in the paint booths by spraying solvents through the guns in the paint booth allowing the filters to catch the waste solvent. Solvents used for cleaning paint guns contained regulated amounts of methyl ethyl ketone, toluene, xylene, methanol and acetone. These solvent make the paint booth filters hazardous waste and must be managed as such. Facility personnel stated that paint booth filters are disposed of in the regular trash. In the future, if the same solvents are used, paint guns should be cleaned into a container managed as a hazardous waste container, or the paint booth filters must be managed as hazardous waste.
- Solvent contaminated paper wipes Paper wipes are being used to clean glue in the wood assembly area with Sta'-Put ST172 thinner. This solvent contains regulated amounts of methylene chloride and trichloroethylene. The wipes are considered hazardous and must be managed appropriately, as discussed during the visit.

Deficiency 2 - Failure to determine, as required by 40 CFR 262.11.

The facility is disposing of waste from two blast cabinets in the regular trash. According to facility personnel, the waste from these blast cabinets has not been analyzed for heavy metals to make an accurate waste determination. The facility must sample waste from each blast cabinet separately. The samples should be tested for RCRA heavy metals. The waste does not need to be tested for mercury. The facility should have a toxicity characteristic leaching procedure (TCLP) test conducted on each sample to determine if the waste is hazardous or not. Results from the analysis should be submitted with the facility's response.

Deficiency 3 – Failure to maintain written waste determinations, as required by 40 CFR 262.40(c).

The facility must maintain a written waste determination for all wastes streams that are potentially hazardous. At the time of inspection, the facility did not have written waste determinations for all waste streams.

Deficiency 4 – Failure to label two containers of universal waste with the proper label, as required by 40 CFR 273.14(e).

At the time of inspection, there were two containers, one box and one light tube, that contained waste fluorescent lamps and were not labeled. Containers of waste lamps that are being managed as universal waste must be labeled "Universal Waste Lamps", "Waste Lamps" or "Used Lamps".

Deficiency 5 – Failure to close one container of universal waste, except when adding or removing waste, as required by 40 CFR 273.13(d)(1).

One box of universal waste lamps was not closed at the time of inspection. Waste lamps were not being added or removed at the time of inspection. All containers of universal waste must retain closed at all times except when adding or removing waste.

Deficiency 6 – Failure to train employees on proper management of universal waste, as required by 40 CFR 273.16.

Facility personnel stated that no training has been conducted addressing the proper management of universal waste. Also, facility personnel stated they did not know that the containers must be closed and did not know what type of label was required on the containers.

Deficiency 7 – Failure to keep all containers of hazardous waste closed at all times except when adding or removing waste, as required by 40 CFR 265.173(a).

One 55-gallon container of hazardous paint waste had a funnel that did not attach to the drum or latch closed with a seal. To meet the state's requirements for a closed container, if using a funnel, the funnel must screw into the bung hole of the drum and must latch closed in a manner that keeps the waste from volatilizing and spilling out if the container is knocked over.

Deficiency 8 – Failure to conduct weekly inspection of hazardous waste storage areas, as required by 40 CFR 265.174.

The facility is conducting monthly inspections of hazardous waste storage containers, but not weekly inspections. As a small quantity generator (SQG) of hazardous waste, the facility must conduct these inspections weekly.

Deficiency 9 – Failure to include time of inspection on the hazardous waste storage container inspection log, as required by 40 CFR 265.15(d).

The facility's weekly inspection log must include complete date and time of inspection, name of inspector (no initials), notations and observations, and date and nature of remedial actions. The facility's inspection log was missing the time of inspection.

Deficiency 10 - Failure to post emergency information, as required by 40 CFR 262.34(d)(5)(ii).

The facility must post, next to at least one telephone which is accessible with little or no delay, the name and telephone number of emergency coordinator(s), location of fire extinguishers, spill control material, and if available, fire alarms, and the telephone number of the fire department unless the facility has a direct alarm (911 is acceptable). If the facility relies solely on cell phones, the information still must be posted, and all posted phone numbers must be programmed into the cell phones.

Deficiency 11 – Failure to establish a hazardous waste training program, as required by KAR 28-31-262a(d)(1).

Facility personnel stated that a hazardous waste training program has not been established. The facility must establish a hazardous waste training program that meets the requirements of 40 CFR 262.34(d)(5)(iii).

The employees must be trained within six months of employment and then on an annual basis after that. A record of the training must be kept of each employee trained, the date of training and the topics covered, for a minimum of three years from the date of training. If the facility relies on cell phones, the training must include the location of the emergency postings.

Deficiency 12 - Wrong EPAID number on manifest, in violation of 40 CFR 262.20(a).

Manifest number 001464373 GBF contained the EPAID # KSD000136872. The facility's EPAID # is KSD007136872. The facility should contact their waste vendor and ensure that the correct number is used in the future.

Deficiency 13 – Failure to include correct page number on multiple manifests, as required by 40 CFR 262.20(a).

During my record review I observed multiple manifests that included a rider manifest (second page) used solely for extra transporters. The first page of these manifests were not corrected to indicate that a second page was used. The facility should contact their waste vendor and ensure that all corrections are made to manifest as required in the future.

Deficiency 14 - Failure to include waste codes on manifests, as required by 40 CFR 262.20(a).

The facility must list up to six waste codes that describe the waste being shipped. My inspection showed that the facility's waste paint related material carries waste codes D001, F002, F003, F005, D035 at a minimum. The facility's manifests show the waste to carry waste codes F003, F005, D007 and D008. During my record review, facility personnel provided me with analytical results that showed the waste does not contain regulated levels of heavy metals, thus waste codes D007 and D008 do not need to be included on the waste manifest. The facility should contact their waste vendor to ensure that the proper waste codes are included on all future hazardous waste shipments.

Deficiency 15 – Failure to retain a copy of the manifest signed and dated by the designated facility, as required by CFR 262.40(a)

The facility must retain a copy of each initial manifest signed and dated by both the generator and the initial transporter until a copy signed and dated by the designated facility is received. Once the copy is received from the designated facility, it must be retained for three years from the date of shipment.

Deficiency 16 – Failure to include manifest number, waste codes and constituents of concern on the land disposal restriction notification form, as required by 40 CFR 268.7(a)(2).

The facility must provide a one-time written notice for each waste stream to the off-site treatment, storage, disposal facility (TSDF) that receives the facilities waste. This notification must include the EPA hazardous waste numbers (waste codes), manifest number for the shipment of waste that the notice was shipped with, constituents of concern for F001-F005, F039 and underlying hazardous constituents in characteristic wastes, applicable wastewater or non-wastewater category and subdivisions and waste analysis data (if available). The facility had multiple LDRs for the waste paint related material waste stream. None of the LDRs included the proper waste codes as discussed in deficiency 14 or a manifest number. Also, the list of constituents of concerns did not include methylene chloride or trichloroethylene. The facility should contact their waste vendor and ensure that a proper LDR is sent with the next manifest to the TSDF. This LDR can be used to replace past LDRs that are on-site. The LDR must be retained for three years after the last time the waste is generated.

This notice is provided to call immediate attention to those areas of non-compliance. This notice does not constitute a compliance order issued by KDHE and may not be a complete listing of all violations which may be identified as a result of this inspection. You must submit in writing by April 16, 2012, all requested materials

Your cooperation with the waste management program is appreciated. If you have questions concerning this letter, please call me.

Respectfully,

1

J alluso Brie

. . .

SECTION 4, FIRST AID MEASURES

EYE CONTACT:

For eyes, flush with plenty of water for 15 minutes & get medical attention.

SKIN CONTACT:

In case of contact with skin immediately remove contaminated clothing. Wash thoroughly with scap & water. Wash contaminated clothing before reuse.

INHALATION:

After high vapor exposure, remove to fresh air. If breathing is difficult, give oxygen. If breathing has stopped give artificial respiration.

SWALLOWING:

If swallowed, CALL A PHYSICIAN IMMEDIATELY! Do NOT induce vomiting. Have patient lie down & keep warm. Vomiting may lead to pneumonitis, which may be fatal.

SECTION 5. FIRE FIGHTING MEASURES

EXTINGUISHING MEDIA NFFA CLass B extinguishers (Carbon Dioxide or foam) for Class I B liquid fires. SPECIAL FIRE FIGHTING PROCEDURES Water spray may be ineffective on fire but dan protect fire-fighters

& cool closed containers. Use fog nozzles if water is used. Do not enter confined fire-space without full bunker gear.

(Helmst with face shield, bunker coats, gloves & rubber boots). Use NIOSE approved positive-pressure self-contained breathing apparatus.

UNUSUAL EXPLOSION AND FIRE PROCEDURES

EXTREMELY FLAMMABLE !! VAPORS CAN CAUSE FLASE FIRE Keep container tightly closed. Isolate from oxidizers, heat, sparks, electric equipment & open flame. Closed containers may explode if exposed to extreme heat. Applying to hot surfaces requires special precautions. Empty container very hazardous! Continue all label precautions!

SECTION 6. ACCIDENTAL RELEASE MEASURES

CONTAINMENT TECHNIQUES

Stop spill at source. Dike area & contain.

CLEAN-UP PROCEDURES:

Clean up remainder with absorbent materials. Mop up & dispose of. Persons without proper protection should be kept from area until cleaned up. OTHER PRECAUTIONS Vapors may ignite explosively & spread long distances. Prevent vapor buildup. Put out pilot lights & turn off heaters, electric equipment & other ignition sources during use & until all vapors are gone. SECTION 7. HANDLING AND STORAGE

HANDLING

Isolate from exidizers, heat, sparks, electric equipment & open flame. Use only with adequate ventilation. Avoid breathing of vapor or spray mist. Avoid contact with skin & eyes.

Wear OSHA Standard goggles or face shield. Consult Safety Equipment Supplier. Wear gloves, apron & footwear impervious to this material. Wash clothing before reuse.

Avoid free fall of liquid. Ground containers when transferring. Do not flame out, saw, drill, braze, or weld. Kmpty container very hazardous! Continue all label precautions!

STORAGE

· .

Vapors may ignite explosively & spread long distances. Prevent vapor buildup. Put out pilot lights & turn off heaters, electric equipment & other ignition sources during use & until all vapors are gone. Do not store above 49 C/120 F. Store large amounts in structures made for OSHA Class I B liquids Kaep container tightly closed

a-upright when not in use to prevent leakage.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION:

. EXFOSURE CONTROLS

: .

Use vapor, mist gas mask within use limits, or ventilate to keep vapors of this material below 40 ppm. If over TLV, in accordance with 29 CFR 1910.134, use NIOSE approved positive-pressure self-contained breathing apparatus. Consult Safety Equipment Supplier. Use explosion-proof equipment.

VENTILATION

Local Erhaust Mrchanical (General) Spectal Other : Necessary : Acceptable : None : None

PERSONAL PROTECTIONS:

Wear OSHA Standard goggles or face shield. Consult Safety Equipment Supplier. Wear gloves, aprom & footwear impervious to this material. Wash clothing before rouse.

WORK & HYGIENIC PRACTICES:

Provide readily accessible eye wash stations & safety showers. Wash at end of each workshift & before eating, smoking or using the toilet. Promptly remove clothing that becomes contaminated. Destroy contaminated leather articles. Launder or discard contaminated clothing. COMPANY IDENTITY: CSU/STARTEX PRODUCT IDENTITY: SW1 LACQUER THINNER NEW MSDS DATE: 05/23/2002

Methyl Ethyl Katone	78-93-3	None Known	300 ppm

ACUTE HAZARDS

EYE & SKIN CONTACT:

Primary irritation to skin, defatting, dermatitis. Absorption thru skin increases exposure. Primary irritation to eyes, redness, tearing, blurred vision. Liquid can cause eye irritation. Wash thoroughly after handling.

INHALATION:

Anesthetic, Irritates respiratory tract. Acute overexposure can cause serious nervous system depression. Vepor harmful. Breathing vapor can cause irritation. Adute overexposure can cause damage to kidneys, blood, nerves, liver & lungs. N. 1 • .

14

.

SWALLOWING:

Harmful or fatal if swallowed. . Swallowing can cause abdominal irritation, nausea, vomiting & diarrhea.

.

SUBCHRONIC HAZARDS/CONDITIONS AGGREVATED.

CONDITIONS AGGREVATED

Chronic overexposure can cause damage to kidneys, blood, nerves, liver & lungs, Persons with severe skin, liver or kidney problems should avoid use.

CHRONIC HAZARDS

CANCER, REPRODUCTIVE & OTHER CHRONIC HAZARDS:

.

Leukenia been reported in humans from Benzene.

This product contains less than 188 ppm of Benzene.

Not considered hazardous in such low concentrations.

Absorption thru skin may be harmful. Studies with leboratory animals

indicate this product can cause demage to fetus.

SECTION 12. ECOLOGICAL INFORMATION

... :

MAMMALIAN INFORMATION: MATERIAL CAS # LOWEST KNOWN LETHAL DOSE DATA LOWEST KNOWN LD50 (ORAL) 108-88-3 3000.0 mg/kg(Rats) Toluene LONEST KNOWN LC50 (VAPORS) Methyl Ethyl Ketone 78-93-3 2000 ppm (Rats) LOWEST KNOWN LD50 (SKIN) 108-88-3 4000.0 mg/kg (Rabbita) Toluene

AQUATIC ANIMAL INFORMATION:

The most sensitive known aquatic group to any component of this product is: Fish 1000 ppm or mg/L (24 hour exposure). Keep out of sewers and natural water supplies.

.

MOBILITY

. . .

This material is a mobile liquid.

DEGRADABILITY

This product is partially blodegradable.

ACCUMULATION

••

This product does not accumulate or biomagnify in the environment.

SECTION 13. DISPOSAL CONSIDERATIONS

Cart for the

17. <u>0</u>941

. Recycle / dispose of observing national, regional, state, provincial and local health, safety & pollution laws.

If questions exist, contact the appropriate agencies.

SECTION 14. TRANSPORT INFORMATION

DOT SHIPPING NAME: Faint Related Material, 3, UN1263, PG-II DRUM LABEL: (PLANMABLE LIQUID) IATA / ICAO; Paint Related Material, 3, UN1263, PG-II INO / IMDG: Paint Related Material, 3, UN1263, PG-II EMERGENCY RESPONSE GUIDEBOOK NUMBER: 128

SECTION 15. REGULATORY INFORMATION

EPA REGULATION: SARA SECTION 311/312 HAZARDS: Acute Health, Fire

All components of this product are on the TSCA list. SARA Title III Section 313 Supplier Notification This product contains the indicated <*> toxic chemicals subject to the reporting requirements of Section 313 of the Emergency Planning & Community Right-To-Know Act of 1986 & of 40 CWR 372. This information must be included in all MSDSs that are copied and distributed for this material.

SECTION IV - FIRE AND EXPLOSION HAZARD DANGER

Flammability Class:	IIIB
Flash Range:	Not Applicable
Explosive Range:	Not Applicable

EXTINGUISHING MEDIA: Foam, dry chemical, carbon dioxide, water spray or fog. SPECIAL FIREFIGHTING PROCEDURES: Avoid breathing smoke. Use air supplied rescue equipment for enclosed area. Water tends to spread burning liquid if large amounts used. UNUSUAL FIRE & EXPLOSION HAZARDS: Container may vent and/or rupture due to fire. Although this material does not have a flash point, it can burn at room

SECTION V - HEALTH HAZARD DATA

~~~~~~

**PERMISSIBLE EXPOSURE LEVEL:** See Section VIII.

#### EFFECTS OF OVEREXPOSURE:

INHALATION: May cause dizziness, nausea, upper respiratory irritation, drowsiness, mental depression or narcosis, difficulty in breathing. Chronic effects of overexposure to solvent vapors could lead to permanent effects of the nervous system, body organs or the brain. Use with adequate ventilation. Loss of consciousness and death at 9000 ppm if exposure is prolonged. EYES: Irritation. SKIN: Removal of skin oils, irritation, dermatitis, even sensitization with long overexposure. INGESTION: May be harmful or fatal if swallowed. Chronic liver and kidney disease, chronic lung disease, anemia, coronary disease or heart disorders.

Methylene Chloride has been shown to cause cancer in certain laboratory animals. Repeated and/or prolonged exposure to high

MSDS Name: TACC N/F SOLVENT/THINNER MSDS Number: ST172

MSDS Last Updated: SEP-29-2000 Page Number: 3 of 5

concentrations has induced liver and kidney and possible cardiac toxicity in experimental animals.

#### FIRST AID:

INHALATION: Get fresh air, if necessary, call Physician. SKIN: Wash with mild soap and water, apply a mild cream. Eyes: Flush with water for at least 15 minutes. Ingestion: Call Poison Center immediately. NOTE TO PHYSICIAN: Adrenalin should never be given to person overexposed to methylene chloride!!!

#### SECTION VI - REACTIVITY DATA

#### INCOMPATIBILITY: Aluminum

CONDITIONS TO AVOID: Highly alkaline materials, i.e.; sodium hydroxide, aluminum. HAZARDOUS DECOMPOSITION PRODUCTS: CO, CO2, Hydrogen Chloride and Phosgene

### SECTION VII - SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Ventilate area. Avoid breathing vapors. Contain spill if possible. Wipe up or absorb with suitable material and shovel up. Prevent entry into sewers and waterways. WASTE DISPOSAL METHOD: Liquid material is designated as hazardous waste until all solvents and vapors have evaporated. Dispose of in accordance with local, state and federal regulations.

**Check For:** Any discrepancies that have potential for pollution to storm water, including: leaks, improper containment, and changes in operations.

Areas To Be Checked (check mark indicated no problems):

- $\sqrt{}$  Each Building (both interior and exterior)
- Outdoor material storage (parts, scrap, etc.)
- Outdoor fluid storage (waste oil containers, etc.)
- Fueling or maintenance areas
- Equipment (both rolling and stationary)
- Structural Control Devices (dikes, berms, grading, vegetation, gravel/concrete, etc.)

Description of Discrepancy and Report of Repair:
